

Stochastic integration - part 3

João Guerra

CEMAPRE and ISEG, UTL

- The stochastic integral $I_t(F)$ with $F \in \mathcal{H}_2$ satisfies:
 - 1 I_t is a linear operator
 - 2 $\mathbb{E}[I(F)] = 0$, $E[(I(F))^2] = \int_0^T \int_E \mathbb{E}[|F(t, \mathbf{x})|^2] \nu(d\mathbf{x}) dt$.
 - 3 $\{I_t(F), t \geq 0\}$ is $\{\mathcal{F}_t\}$ adapted
 - 4 $\{I_t(F), t \geq 0\}$ is a square-integrable martingale.

Sketch of the Proof of (3): Let $(F_n, n \in \mathbb{N})$ be a sequence of simple processes in \mathcal{H}_2 converging to F .

Then $(I_t(F_n), t \geq 0)$ is adapted and $I_t(F_n) \rightarrow I_t(F)$ in L^2 .

Therefore, there is a subsequence $(F_{n_k}; n_k \in \mathbb{N})$ such that $I_t(F_{n_k}) \rightarrow I_t(F)$ a.s. as $n_k \rightarrow \infty$.

Therefore $\{I_t(F), t \geq 0\}$ is $\{\mathcal{F}_t\}$ adapted. ■

Sketch of the Proof of (4):

Let F be a simple process in \mathcal{H}_2 and choose $0 < s = t_l < t_{l+1} < t$.

Then $I_t(F) = I_s(F) + I_{s,t}(F)$ and by prop. (3),

$$\mathbb{E}_s(I_t(F)) = I_s(F) + \mathbb{E}_s(I_{s,t}(F))$$

Moreover,

$$\begin{aligned} \mathbb{E}_s(I_{s,t}(F)) &= \mathbb{E}_s \left(\sum_{j=l+1}^m \sum_{k=1}^n F_k(t_j) M((t_j, t_{j+1}], A_k) \right) \\ &= \sum_{j=l+1}^m \sum_{k=1}^n \mathbb{E}_s(F_k(t_j)) \mathbb{E}_s[M((t_j, t_{j+1}], A_k)] = 0. \end{aligned}$$

Therefore $\mathbb{E}_s(I_t(F)) = I_s(F)$ and $\{I_t(F), t \geq 0\}$ is a martingale.

Now, let $(F_n, n \in \mathbb{N})$ be a sequence of simple processes converging to F in L^2 . It can be proved that (see Applebaum) $\mathbb{E}_s(I_t(F_n)) \rightarrow \mathbb{E}_s(I_t(F))$ in L^2 and therefore $\mathbb{E}_s(I_t(F)) = I_s(F)$ is a square-integrable martingale ■

- The stochastic integrals can be defined in an extended space: \mathcal{P}_2 (where $\mathcal{H}_2 \subset \mathcal{P}_2$), defined as the set of all mappings $F : [0, T] \times E \times \Omega \rightarrow \mathbb{R}$
 - 1) F is predictable
 - 2) $P \left[\int_0^T \int_E |F(t, x)|^2 \rho(dt, dx) < \infty \right] = 1$
- If $F \in \mathcal{P}_2$ then $\{I_t(F), t \geq 0\}$ is a local martingale but not necessarily a martingale.
- If $E = \{0\}$ we use the notation $\mathcal{P}_2(T)$ for \mathcal{P}_2 .
- Therefore $\mathcal{P}_2(T)$ is the set of all predictable mappings $F : [0, T] \times \Omega \rightarrow \mathbb{R}$ such that

$$P \left[\int_0^T \int_E |F(t, x)|^2 dt < \infty \right] = 1$$

Lévy type stochastic integrals

- We say Y is a Lévy type stochastic integral if

$$\begin{aligned}
 Y_t^i &= Y_0 + \int_0^t G^i(s) ds + \int_0^t F_j^i(s) dB_s^j + \int_0^t \int_{|x| < 1} H^i(s, x) \tilde{N}(ds, dx) \\
 &+ \int_0^t \int_{|x| \geq 1} K^i(s, x) N(ds, dx), \quad i = 1, \dots, d, j = 1, \dots, m \quad (1)
 \end{aligned}$$

where $|G^i|^{\frac{1}{2}}, F_j^i \in \mathcal{P}_2(T)$ and $H^i \in \mathcal{P}_2$ and K is predictable.

- With stochastic differentials notation, we can write:

$$\begin{aligned}
 dY(t) &= G(t) dt + F(t) dB(t) + \int_{|x| < 1} H^i(t, x) \tilde{N}(dt, dx) \\
 &+ \int_{|x| \geq 1} K^i(t, x) N(dt, dx)
 \end{aligned}$$

Lévy type stochastic integrals

- Let M be an adapted and left-continuous process. Then we can define a new process $\{Z_t, t \geq 0\}$ by

$$dZ(t) = M(t) dY(t)$$

or

$$dZ(t) = M(t) G(t) dt + M(t) F(t) dB(t) + M(t) H(t, x) \tilde{N}(dt, dx) + M(t) K(t, x) N(dt, dx).$$

Example - Lévy stochastic integrals

- X : Lévy process with characteristics (b, A, ν) and Lévy-Itô decomposition

$$X(t) = bt + B_A(t) + \int_{|x| < 1} x \tilde{N}(t, dx) + \int_{|x| \geq 1} x N(t, dx).$$

Let $L \in \mathcal{P}_2(t)$ for all $t \geq 0$. and choose $F_j^i = A_j^i L$, $H^i = K^i = x^i L$.

- The process Y such that

$$dY(t) = L(t) dX(t)$$

is called a Lévy stochastic integral.

Example - Ornstein Uhlenbeck (OU) process

- OU process:

$$Y(t) = e^{-\lambda t} y_0 + \int_0^t e^{-\lambda(t-s)} dX(s),$$

where y_0 is fixed.

- The condition

$$\int_{|x|>1} \log(1 + |x|) \nu(dx) < \infty$$

is necessary and sufficient for the process to be stationary.

- This process can be used for volatility modelling in finance.
- Exercise: Prove that if X is a one-dimensional Brownian motion then $Y(t)$ is a Gaussian process with mean $e^{-\lambda t} y_0$ and variance $\frac{1}{2\lambda} (1 - e^{-2\lambda t})$

Example - Ornstein Uhlenbeck (OU) process

- In differential form the OU process is the solution of the SDE:

$$dY(t) = -\lambda Y(t) dt + dX(t),$$

which is known as the Langevin equation.

- The Langevin equation is also a model for the physical phenomenon of Brownian motion: includes the viscous drag of the medium on the particle as well as random fluctuations.

Itô formula for Poisson stochastic integrals

- Consider the Poisson stoch. integral

$W^i(t) = W^i(0) + \int_0^t \int_A K^i(s, x) N(ds, dx)$, with A bounded below and the K^i 's predictable.

Lemma

(Itô formula 1): If $f \in C(\mathbb{R}^d)$ then

$$f(W(t)) - f(W(0)) = \int_0^t \int_A [f(W(s-) + K(s, x)) - f(W(s-))] N(ds, dx) \quad \text{a.s.}$$

Itô formula for Poisson stochastic integrals

Proof: Let $Y(t) = \int_A x N(dt, dx)$. The jump times of Y can be defined by $T_0^A = 0$, $T_n^A = \inf \{t > T_{n-1}^A; \Delta Y(t) \in A\}$
Then

$$\begin{aligned} f(W(t)) - f(W(0)) &= \sum_{0 \leq s \leq t} [f(W(s)) - f(W(s-))] \\ &= \sum_{n=1}^{\infty} [f(W(t \wedge T_n^A)) - f(W(t \wedge T_{n-1}^A))] \\ &= \sum_{n=1}^{\infty} [f(W(t \wedge T_n^A-) + K(t \wedge T_n^A, \Delta Y(t \wedge T_n^A))) - f(W(t \wedge T_n^A-))] \\ &= \int_0^t \int_A [f(W(s-) + K(s, x)) - f(W(s-))] N(ds, dx). \end{aligned}$$

Itô formula for Brownian motion

- Let M be a Brownian integral with drift:

$$M^i(t) = \int_0^t F_j^i(s) dB^j(s) + \int_0^t G^i(s) ds,$$

with $F_j^i, |G^i|^{\frac{1}{2}} \in \mathcal{P}_2(t)$.

- Let us define the quadratic variation process:

$$[M^i, M^j](t) = \sum_{k=1}^m \int_0^t F_k^i(s) F_k^j(s) ds.$$

Itô formula for Brownian motion

Theorem

(Itô formula 2) If $f \in C^2(\mathbb{R}^d)$ then

$$f(M(t)) - f(M(0)) = \int_0^t \partial_i f(M(s)) dM^i(s) + \frac{1}{2} \int_0^t \partial_i \partial_j f(M(s)) d[M^i, M^j](s) \quad \text{a.s.}$$

Proof: See Applebaum

Itô formula for Lévy type stochastic integrals

- Let

$$dY(t) = G(t) dt + F(t) dB(t) + \int_{|x| < 1} H(t, x) \tilde{N}(dt, dx) + \int_{|x| \geq 1} K(t, x) N(dt, dx)$$

- $dY_c(t) = G(t) dt + F(t) dB(t)$
- $dY_d(t) = \int_{|x| < 1} H(t, x) \tilde{N}(dt, dx) + \int_{|x| \geq 1} K(t, x) N(dt, dx)$

Itô formula for Lévy type stochastic integrals

Theorem

(Itô formula 3): If $f \in C^2(\mathbb{R}^d)$ then

$$\begin{aligned} f(Y(t)) - f(Y(0)) &= \int_0^t \partial_i f(Y(s-)) dY_c^i(s) + \frac{1}{2} \int_0^t \partial_i \partial_j f(Y(s-)) d[Y_c^i, Y_c^j](s) \\ &+ \int_0^t \int_{|x| \geq 1} [f(Y(s-) + K(s, x)) - f(Y(s-))] N(ds, dx) \\ &+ \int_0^t \int_{|x| < 1} [f(Y(s-) + H(s, x)) - f(Y(s-))] \tilde{N}(ds, dx) \\ &+ \int_0^t \int_{|x| < 1} [f(Y(s-) + H(s, x)) - f(Y(s-)) \\ &- H^i(s, x) \partial_i f(Y(s-))] \nu(dx) ds \end{aligned}$$

- Proof: see Applebaum

Itô formula for Lévy type stochastic integrals

Theorem

(Itô formula 4): If $f \in C^2(\mathbb{R}^d)$ then

$$f(Y(t)) - f(Y(0)) = \int_0^t \partial_i f(Y(s-)) dY^i(s) + \frac{1}{2} \int_0^t \partial_i \partial_j f(Y(s-)) d[Y_c^i, Y_c^j](s) + \sum_{0 \leq s \leq t} [f(Y(s)) - f(Y(s-)) - \Delta Y^i(s) \partial_i f(Y(s-))].$$

- Proof: see Applebaum

Itô formula for Lévy type stochastic integrals

- Quadratic variation process for Y :

$$[Y^i, Y^j](t) = [Y_c^i, Y_c^j](t) + \sum_{0 \leq s \leq t} \Delta Y^i(s) \Delta Y^j(s).$$

-

$$[Y^i, Y^j](t) = \sum_{k=1}^m \int_0^t F_k^i(s) F_k^j(s) ds + \int_0^t \int_{|x| < 1} H^i(s, x) H^j(s, x) \tilde{N}(ds, dx) \quad (2)$$

$$+ \int_0^t \int_{|x| \geq 1} K^i(s, x) K^j(s, x) N(ds, dx).$$

Itô's product formula

Theorem

If Y^1 and Y^2 are real valued Lévy type stochastic integrals then

$$Y^1(t) Y^2(t) = Y^1(0) Y^2(0) + \int_0^t Y^1(s-) dY^2(s) + \int_0^t Y^2(s-) dY^1(s) + [Y^1, Y^2](t).$$

Proof Take $f(x_1, x_2) = x_1 x_2$ and apply Itô's formula 4:

$$\begin{aligned} Y^1(t) Y^2(t) - Y^1(0) Y^2(0) &= \int_0^t Y^1(s-) dY^2(s) \\ &+ \int_0^t Y^2(s-) dY^1(s) + [Y_c^1, Y_c^2](t) \\ &+ \sum_{0 \leq s \leq t} [Y^1(s) Y^2(s) - Y^1(s-) Y^2(s-) - \Delta Y^1(s) Y^2(s-) - \Delta Y^2(s) Y^1(s-)] \end{aligned}$$

and the result follows.

Itô's product formula

- Product formula in differential form:

$$d(Y^1(t) Y^2(t)) = Y^1(t-) dY^2(t) + Y^2(t-) dY^1(t) + d[Y^1, Y^2](t).$$

- The Itô correction arises as the result of the following formal product relations (see (2)):

$$dB^i(t) dB^j(t) = \delta^{ij} dt,$$

$$N(dt, dx) N(dt, dy) = N(dt, dx) \delta(x - y),$$

all other products of differential vanish.
