

Financial Markets and Investments

Formulas

Basic Concepts: R_i – random return of asset i ; $\bar{R}_i = \mathbb{E}(R_i)$;

$$\begin{aligned}\sigma_i^2 &= \text{Var}(R_i) = \mathbb{E}[(R_i - \bar{R}_i)^2] = \mathbb{E}(R_i^2) - [\mathbb{E}(R_i)]^2 ; & \Rightarrow \sigma_i &= \sqrt{\text{Var}(R_i)} ; \\ \sigma_{ij} &= \text{Cov}(R_i, R_j) = \mathbb{E}[(R_i - \bar{R}_i)(R_j - \bar{R}_j)] ; & \Rightarrow \rho_{ij} &= \frac{\sigma_{ij}}{\sigma_i \sigma_j} .\end{aligned}$$

Portfolios P of n assets: x_i – proportion of the initial wealth W_0 invested in asset i .

$$\begin{aligned}\bar{R}_P &= \sum_{i=1}^n x_i \bar{R}_i & \sigma_P^2 &= \sum_{i=1}^n \sum_{j=1}^n x_i x_j \sigma_{ij} = \sum_{i=1}^n x_i^2 \sigma_i^2 + \sum_{i=1}^n \sum_{j=1, j \neq i}^n x_i x_j \sigma_{ij} \\ \text{Homogeneous portfolios: } \sigma_H^2 &= \frac{1}{n} \overbrace{\left[\sum_{i=1}^n \left(\frac{\sigma_i^2}{n} \right) \right]}^{\sigma_i^2} + \frac{n-1}{n} \overbrace{\left[\sum_{i=1}^n \sum_{j=1, j \neq i}^n \frac{\sigma_{ij}}{n(n-1)} \right]}^{\sigma_{ij}}\end{aligned}$$

Mean-Variance Theory (MVT) ($n = 2$) $\Rightarrow x_1^{MV} = \frac{\sigma_2^2 - \sigma_{12}}{\sigma_1^2 + \sigma_2^2 - 2\sigma_{12}}$

MVT – vector notation (n risky assets):

$$\bar{R} = \begin{pmatrix} \bar{R}_1 \\ \bar{R}_2 \\ \vdots \\ \bar{R}_n \end{pmatrix} \quad V = \begin{pmatrix} \sigma_1^2 & \sigma_{12} & \cdots & \sigma_{1n} \\ \sigma_{21} & \sigma_2^2 & \cdots & \sigma_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \sigma_{n1} & \sigma_{n2} & \cdots & \sigma_n^2 \end{pmatrix} \quad X = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix} \quad \mathbb{1} = \begin{pmatrix} 1 \\ 1 \\ \vdots \\ 1 \end{pmatrix}$$

- Portfolio ($X'_P \mathbb{1} = 1$): $\bar{R}_P = X'_P \bar{R}$ $\sigma_P^2 = X'_P V X_P$ $\text{Cov}(R_P, R_{P2}) = X'_P V X_{P2}$

- Hyperbola:
$$\sigma_P^2 = \frac{A \bar{R}_P^2 - 2B \bar{R}_P + C}{AC - B^2}$$

$$\text{where } A = \mathbb{1}' V^{-1} \mathbb{1} \quad B = \mathbb{1}' V^{-1} \bar{R} \quad C = \bar{R}' V^{-1} \bar{R} .$$

- Minimum Variance Portfolio:
$$X_{MV} = \frac{1}{A} V^{-1} \mathbb{1}$$

- Tangent Portfolio

– Shortselling allowed:

$$Z = V^{-1} [\bar{R} - R_f]$$

* unlimited:

$$\Rightarrow x_i^T = \frac{z_i}{\sum_{i=1}^n z_i} \quad X_T = \frac{Z}{Z' \mathbb{1}}$$

* restricted (Lintner):

$$\Rightarrow x_i^T = \frac{z_i}{\sum_{i=1}^n |z_i|} \quad X_T = \frac{Z}{|Z'| \mathbb{1}}$$

* real-life restrictions:

$n = 2 \Rightarrow$ trivial , $n \geq 3 \Rightarrow$ numerical solution.

– Shortselling forbidden:

$n = 2 \Rightarrow$ trivial , $n \geq 3 \Rightarrow$ numerical solution.

MVT – return generating models:

- Constant Correlation Model: $\rho_{ij} = \rho \quad \forall i, j$

$$\text{Ranking} = \frac{\bar{R}_i - R_f}{\sigma_i}; \quad C_k = \frac{\rho \sum_{i=1}^k \left(\frac{\bar{R}_i - R_f}{\sigma_i} \right)}{1 - \rho + k\rho} \text{(cut-off)}; \quad Z_i = \frac{1}{(1 - \rho)\sigma_i} \left(\frac{\bar{R}_i - R_f}{\sigma_i} - C^* \right)$$

- Single Index Model: $R_i = \alpha_i + \beta_i R_M + e_i; \quad \sigma_i^2 = \beta_i^2 \sigma_M^2 + \sigma_{e_i}^2; \quad \sigma_{ij} = \beta_i \beta_j \sigma_M^2.$

$$\text{Blume's adjust.: } \beta_{2i} = a + b\beta_{1i} \quad \text{Vasicek's adjust.: } \beta_{2i} = \frac{\sigma_{\beta_{1i}}^2}{\sigma_{\beta_{1i}}^2 + \sigma_{\beta_1}^2} \bar{\beta}_1 + \frac{\sigma_{\beta_1}^2}{\sigma_{\beta_{1i}}^2 + \sigma_{\beta_1}^2} \beta_{1i}$$

$$\text{Ranking} = \frac{\bar{R}_i - R_f}{\beta_i}; \quad C_k = \frac{\sigma_m^2 \sum_{i=1}^k \frac{(\bar{R}_i - R_f)\beta_i}{\sigma_{e_i}^2}}{1 + \sigma_m^2 \sum_{i=1}^k \frac{\beta_i^2}{\sigma_{e_i}^2}} \text{(cut-off)}; \quad Z_i = \frac{\beta_i}{\sigma_{e_i}^2} \left(\frac{\bar{R}_i - R_f}{\beta_i} - C^* \right)$$

- Multi-index Model: $R_i = a_i + \sum_{k=1}^K b_{ik} I_k + c_i; \quad \sigma_i^2 = \sum_{k=1}^K b_{ik}^2 \sigma_{I_k}^2 + \sigma_{c_i}^2; \quad \sigma_{ij} = \sum_{k=1}^K b_{ik} b_{jk} \sigma_{I_k}^2$

Investor Preferences - Expected Utility Theory

- For the utility function $U(W)$

$$\text{ARA: } A(W) = -\frac{U''(W)}{U'(W)}; \quad \text{RRA: } R(W) = WA(W)$$

$$\text{2nd ord. Taylor approx. : } U(W) \approx U(W_0) + U'(W_0)(W - W_0) + \frac{1}{2}U''(W_0)(W - W_0)^2$$

- Risk tolerance function (RTF) with domain (σ, \bar{R}) is $f(\sigma, \bar{R}) = \mathbb{E}[U(W)]$.
- The indifference curves of the RTF are : $f(\sigma, \bar{R}) = K$, for constant levels K .

Investor Preferences - other Geometric average: $\bar{R}_i^G = \prod_{m=1}^M (1 + R_{ij})^{p_{ij}} - 1;$

“Safety First”: (Roy) $\min \Pr(R_p < R_L)$, (Kataoka) $\max R_L$, (Telser) $\max \bar{R}_p$,
s.a. $\Pr(R_p < R_L) \leq \alpha$ *s.a.* $\Pr(R_p \leq R_L) \leq \alpha$

Equilibrium Models

$$\text{CAPM: } \bar{R}_i^{eq} = a + \beta_i b \Rightarrow \bar{R}_i^{eq} = R_f + \beta_i (\bar{R}_M - R_f); \quad \beta_i = \frac{\sigma_{iM}}{\sigma_M^2}$$

$$\text{APT: } \bar{R}_i^{eq} = \lambda_0 + \sum_{j=1}^J b_{ij} \lambda_j \Rightarrow \bar{R}_i^{eq} = R_f + b_{i1} (\bar{I}_1 - R_f) + \sum_{j=1}^J b_{ij} (\bar{I}_j - R_f)$$

Performance indicators:

$$\text{Sharpe: } SR = \frac{\bar{R}_p - R_f}{\sigma_p}; \quad \text{Treynor: } TY = \frac{\bar{R}_p - R_f}{\beta_p}; \quad \text{Jensen: } J = R_p - (R_f + \beta_p [\bar{R}_M - R_f])$$
