What is Machine Learning?

What is Machine Learning?

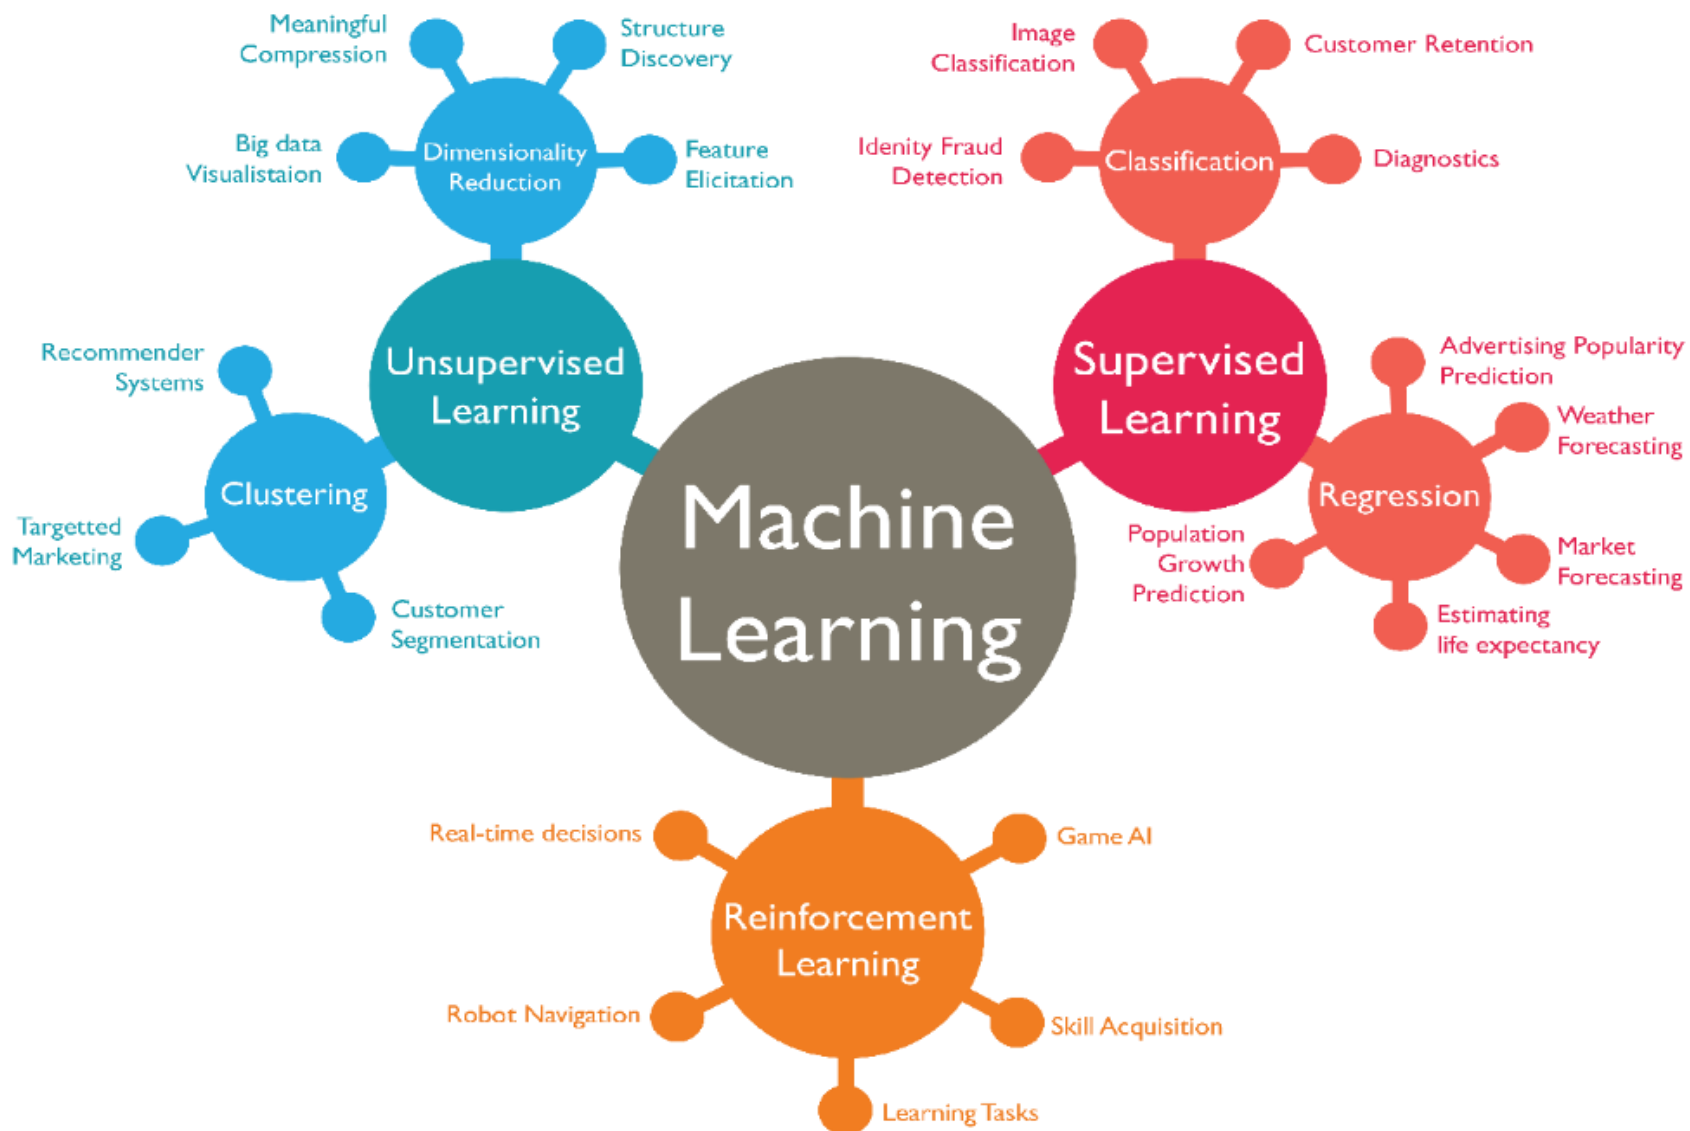

Machine Learning

- is as a subset of artificial intelligence that enable systems to learn patterns from data and subsequently improve from experience

Tradicional programming vs. Machine Learning

- Machine Learning Algorithms

I. INTRODUCTION

Prediction has been one of the main objectives of pursuit science is or at least creating models that may help understand reality and further help prediction. [12] In recent years

statistics, energy price, and alternative investment (or cost of opportunity) on bitcoins prices. The second purpose is to identify the algorithm with better predicting power. To do it, we use several machine learning algorithms.

- Aparicio, Romao & Costa (2022)

```

import numpy as np
from sklearn.linear_model import LinearRegression
from sklearn.model_selection import train_test_split
from sklearn.metrics import mean_squared_error, r2_score

# Simulated data: Advertising Spending and Monthly (X) Sales Revenue (Y)
X = 2* np.random.rand(100,1)
y = 4 + 3 * X + np.random.rand(100,1)

# Split into training and testing sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)

# Create and train the regression model
model = LinearRegression()
model.fit(X_train, y_train)

# Make predictions
y_pred = model.predict(X_test)

# Model performance metrics
mse = mean_squared_error(y_test, y_pred)
r2 = r2_score(y_test, y_pred)

# Display results
print("Intercept",model.intercept_)
print("Coefficient:",model.coef_[0])
print("Mean Squared Error:",mse)
print("R2 Score",r2)

```

```

Intercept [4.60117579]
Coefficient: [2.9097001]
Mean Squared Error: 0.07131786715135546
R2 Score 0.9806885236616626

```

```
import matplotlib.pyplot as plt
# Plot the results

CORRELATION
DOES NOT IMPLY
CAUSATION.

Inference

- Given a dataset, the purpose is to infer how the output is generated as a function of the data.
- Use the model to learn about the data generation process.
- Understand the way the independent variables X affect the target variable Y .
- Ex: find out what the effect of passenger gender, class and age, has on surviving the Titanic Disaster
- Model interpretability is a necessity for inference
- **Causal inference** provides a rigorous framework for identifying cause-and-effect relationships from data.

- Explainable artificial intelligence (XAI)
- is a set of processes and methods
- that allows human users to comprehend and trust
- the results and output created by machine learning algorithms

Prediction

- Use the model to predict the outcomes for new data points.
- When performing predictions over data, the purpose is estimating f in $y=f(x)$
- The purpose is not understanding the exact form of the estimated function, as far as it can perform predictions quite accurately.
- To be able to predict what the responses are going to be to future input variables.
- Ex: predict prices of oil

Machine Learning

- Supervised Learning:
 - Classification
 - Regression
- Unsupervised Learning
 - Clustering
 - Dimensional Reduction
- Reinforcement Learning

Deep learning

- is a subfield of machine learning
- focuses on the development and application of artificial neural networks, particularly deep neural networks.
 - composed of layers of interconnected nodes (artificial neurons) that can learn and make decisions.
- The term "deep" refers to the use of multiple layers in the neural network.

Natural Language Processing (NLP)

- subfield of artificial intelligence
- focuses on the interaction between computers and human language.
- The goal of NLP is to enable computers to understand, interpret, and generate human language in a way that is both meaningful and contextually relevant.
- involves the application of computational techniques and models to analyze and derive meaning from natural language data.
- Sentiment Analysis e increasing importance (Aparicio et al, 2021, Costa et al., 2021)

Emotion analysis of Portuguese Political Parties Communication over the covid-19 Pandemic

Abstract — In this paper, we explore the use of emotions in the Portuguese political parties' (with a seat in the Portuguese Parliament) communication as expressed by their official Twitter accounts, as of March 2020. The chosen period of our investigation is particularly interesting because political parties had a chance to communicate their views during a pandemic situation and over a period of one year. These views include possible solutions to face the crisis and their comments on the development of the whole situation. Using a standard lexicon we classified the amount of particular emotions in different tweets. Using this method we plotted the average positivity and negativity along time per party. We also analyzed the impact of each emotion to classify positivity using the present corpus. Finally, we considered some important words regarding the pandemic and their average positivity score. The analysis allows us to identify different approaches to participation in social media according to different strategies, more than political ideology.

Keywords - political communication; Portuguese political parties; Portuguese parliament; Portuguese; lexicon; sentiment analysis; emotions; visualization; social media; twitter; covid-19.

I. INTRODUCTION

Now-a-days, different political actors are increasingly using social media platforms to communicate their worldviews. American Presidents have used Twitter heavily to communicate their position in relation to specific ideas and to specific policies [5]. Hence it is essential to analyse what is being communicated and even more important how this communication is being done in order to best assess their impact. Political communication can help us explain the ups and downs of the electoral polls and the electoral success of a certain political party or individual in the following election.

The publication of *The Gutenberg Galaxy: The Making of Typographic Man* [8] considers the effects of social media in different human dimensions. However, a new empirical approach is needed, one that considers the effects of social networks or to put it simply a Zuckerberg Galaxy approach which demonstrates how Facebook, Twitter, and other social media are used and to what extent they have a more decisive influence on some of the voters, in comparison to the traditional

media. In this context, the evolution in Natural Language Processing (NLP) and sentiment analysis is significant, however the political communication in Portugal has not yet been a subject of this kind of study, since the available models and lexicons are not yet adapted to European Portuguese. In this sense, we aim to answer the following question: What are the prevalent emotions in the Portuguese political parties' tweets during over the first year of the covid-19 pandemic?

The purpose of the work performed in this paper is to analyse the communication of the official Twitter accounts of the Portuguese political parties. The time frame ranges through 3200 last tweets, going as back as March 2020, when the first case of covid-19 was registered in the country. This period is specially interesting because political parties had a chance to communicate to the electorate their ideas in face of a social and economic crisis. It is important to take into consideration that the different parties tweeted with a different frequency, however the reality they were facing was one and the same.

II. LITERATURE REVIEW

Sentiment analysis refers to using several approaches, such as: natural language processing, text analysis, computational linguistics, and biometrics, to systematically identify, extract, quantify, and study affective states and subjective information.

Emotions can be reactions to internal stimuli (such as thoughts or memories) or events in our environment. To analyze emotions, Mohammad and Turney [1] proposed a lexicon. This lexicon uses six emotions [2], [3]: joy, sadness, anger, fear, disgust, and surprise, along with how positive and negative the words are. These are a subset of the eight emotions proposed in Plutchik [4] which are still relevant today [10]. Recently the study of the impact of texts on such emotions has been done, namely in the USA political context [5]. This was done with a focus on awareness and topical emergence. However, there was no analysis over the emotion on the content of the message shared by the political parties, instead it was focused on its reception using Twitter users from states with opposing political views. This analysis was done over the covid-19 pandemic period, from 9th of March to the 13th of December, not encompassing any analysis over 2021. The study was composed of three stages, unigram frequencies identification, sentiment analysis and then topic modeling. The

Data Science

- includes techniques developed in some traditional fields like artificial intelligence, statistics or machine learning.

Aparicio et al. (2019).

Generative AI

- Class of AI algorithms and models that are designed to generate new, original content.
- Gen AI learn the underlying patterns and structures in the data and can generate novel outputs.
- *Instead of being trained on specific examples and then making predictions or classifications*
- These models are particularly good at creating content that resembles or is similar to the data they were trained on.

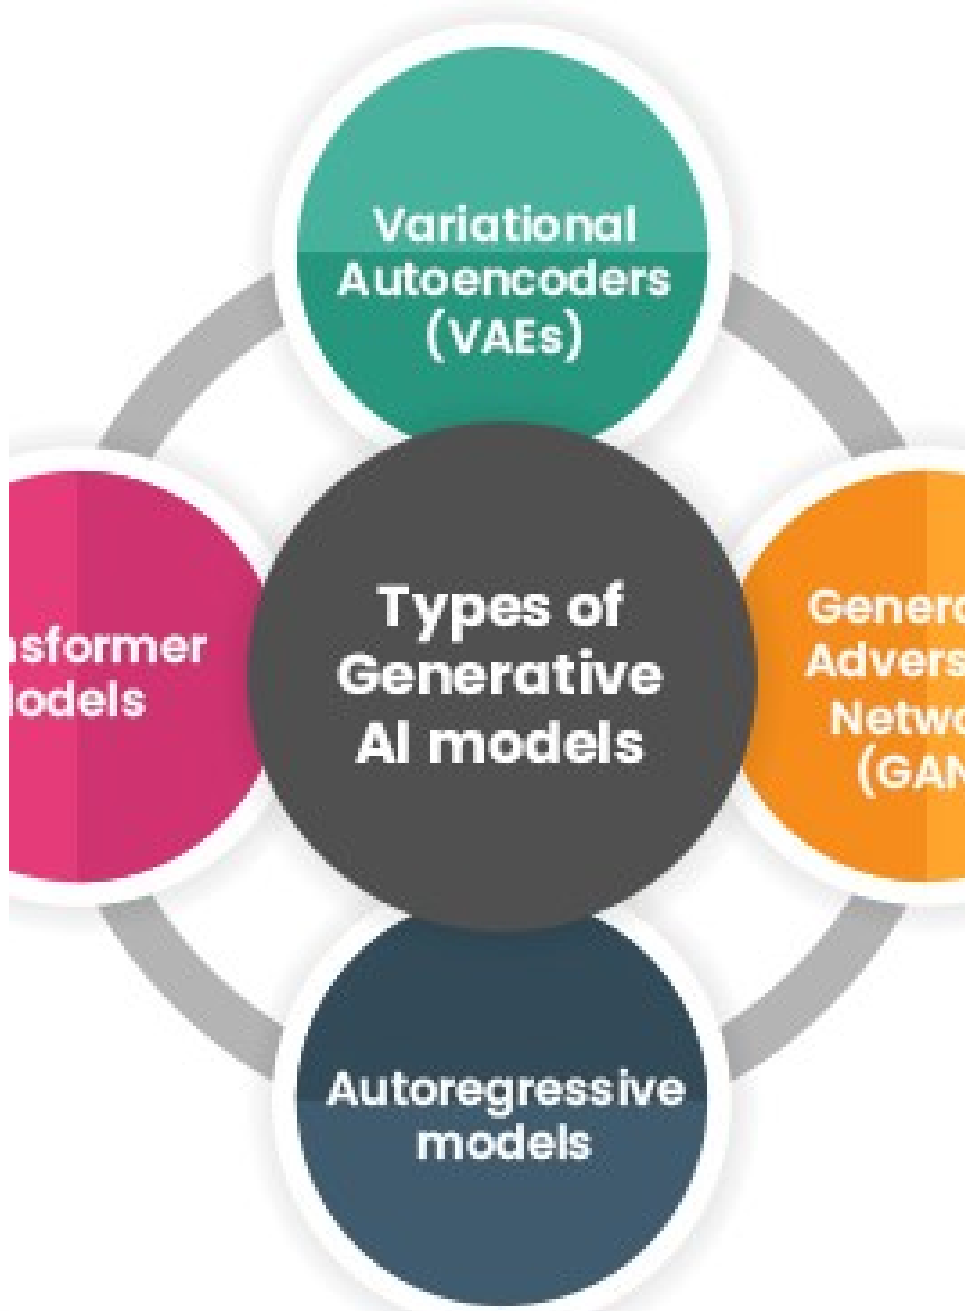

Generative AI

Guessing next word

Markov Chain

Training model

Types of generative AI models

- Generative Adversarial Networks (GANs)
- Variational Autoencoders (VAEs)
- Autoregressive Models
- Recurrent Neural Networks (RNNs)
- Transformer-based Models
- Reinforcement Learning for Generative Tasks
- Generative AI for Data Privacy, Security and Governance.

Types of generative AI models

$$y_t = c + \sum_{i=1}^p a_{t-i} y_{t-i} + e_t$$

- Generative Adversarial Networks (GANs):
 - a **generator** and a **discriminator** are trained simultaneously through adversarial training.
- Variational Autoencoders (VAEs):
 - learn a probabilistic mapping from the observed data to a latent space.
 - Good to generate new samples from the learned latent space.
- Autoregressive Models:
 - the probability distribution of the next value in a sequence depends on the previous values.

Types of generative AI models

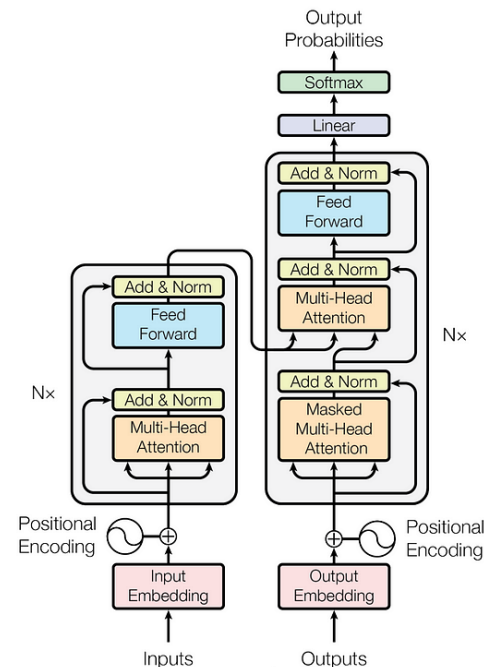

- Recurrent Neural Networks (RNNs):
 - RNNs are commonly used for sequence tasks, including some generative tasks, they are not exclusively generative models.
 - Variants like **LSTM** and GRU are popular choices.
- Transformer-based Models:
 - Transformers, especially large language models.
- Reinforcement Learning for Generative Tasks:
 - can be used in conjunction with generative models, and this combination is powerful in scenarios where the generative model needs to produce sequences or structures guided by a reward signal.

Abstract

The dominant sequence transduction models are based on complex recurrent or convolutional neural networks that include an encoder and a decoder. The best performing models also connect the encoder and decoder through an attention mechanism. We propose a new simple network architecture, the Transformer, based solely on attention mechanisms, dispensing with recurrence and convolutions entirely. Experiments on two machine translation tasks show these models to be superior in quality while being more parallelizable and requiring significantly less time to train. Our model achieves 28.4 BLEU on the WMT 2014 English-to-German translation task, improving over the existing best results, including ensembles, by over 2 BLEU. On the WMT 2014 English-to-French translation task, our model establishes a new single-model state-of-the-art BLEU score of 41.0 after training for 3.5 days on eight GPUs, a small fraction of the training costs of the best models from the literature.

1 Introduction

Recurrent neural networks, long short-term memory [12] and gated recurrent [7] neural networks in particular, have been firmly established as state of the art approaches in sequence modeling and transduction problems such as language modeling and machine translation [29, 2, 5]. Numerous efforts have since continued to push the boundaries of recurrent language models and encoder-decoder architectures [31, 21, 13].

GPT

- Generative Pre-trained Transformer
- Is a type of autoregressive language model that uses a transformer architecture.
- Is pre-trained on a large corpus of text data and can then be fine-tuned for specific tasks.

Google Gemini

Bard is a conversational AI chatbot powered by a combination of generative AI techniques, including:

- **Transformer-based models:**

- Google's Pathways Language Model (PaLM) is used to generate text that is fluent, coherent, and grammatically correct.

- **Autoregressive models**

- to predict the next word in a sequence, which helps to ensure that its responses are natural and engaging.

- **Reinforcement learning:**

- it is rewarded for generating responses that are informative, comprehensive, and relevant to the user's query.

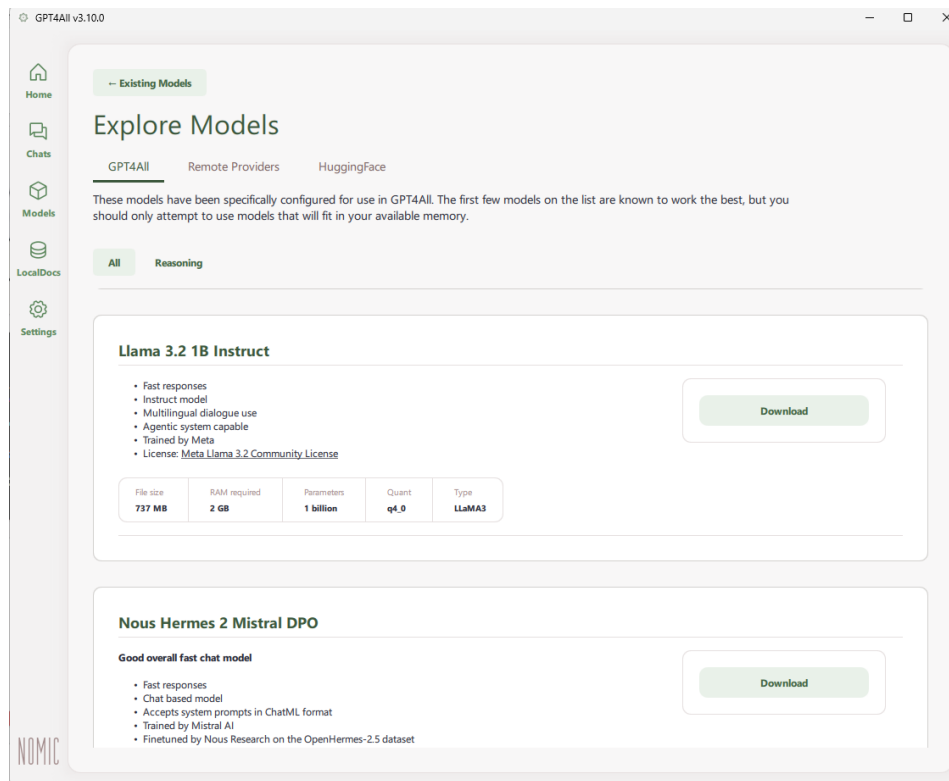

Feature	LaMDA	PaLM	Gemini

DeepSeek-V3 Technical Report

DeepSeek-AI
research@deepseek.com

Abstract

We present DeepSeek-V3, a strong Mixture-of-Experts (MoE) language model with 671B total parameters with 37B activated for each token. To achieve efficient inference and cost-effective training, DeepSeek-V3 adopts Multi-head Latent Attention (MLA) and DeepSeekMoE architectures, which were thoroughly validated in DeepSeek-V2. Furthermore, DeepSeek-V3 pioneers an auxiliary-loss-free strategy for load balancing and sets a multi-token prediction training objective for stronger performance. We pre-train DeepSeek-V3 on 14.8 trillion diverse and high-quality tokens, followed by Supervised Fine-Tuning and Reinforcement Learning stages to fully harness its capabilities. Comprehensive evaluations reveal that DeepSeek-V3 outperforms other open-source models and achieves performance comparable to leading closed-source models. Despite its excellent performance, DeepSeek-V3 requires only 2.788M H800 GPU hours for its full training. In addition, its training process is remarkably stable. Throughout the entire training process, we did not experience any irrecoverable loss spikes or perform any rollbacks. The model checkpoints are available at <https://github.com/deepseek-ai/DeepSeek-V3>.

Abstract — The widespread adoption of generative artificial intelligence (AI) has fundamentally transformed technological landscapes and societal structures in recent years. Our objective is to identify the primary methodologies that may be used to help predict the economic and social impacts of generative AI adoption. Through a comprehensive literature review, we uncover a range of methodologies poised to assess the multifaceted impacts of this technological revolution. We explore Agent-Based Simulation (ABS), Econometric Models, Input-Output Analysis, Reinforcement Learning (RL) for Decision-Making Agents, Surveys and Interviews, Scenario Analysis, Policy Analysis, and the Delphi Method. Our findings have allowed us to identify these approaches' main strengths and weaknesses and their adequacy in coping with uncertainty, robustness, and resource requirements.

Keywords —Generative AI; AI adoption; methods; prediction; methodology.

I. INTRODUCTION

In recent years, generative artificial intelligence (AI) usage has revolutionized technological landscapes and profoundly reshaped the societal structure. This transformative force, marked by its ability to generate novel content, ideas, and solutions autonomously, has sparked unprecedented levels of innovation across various sectors [14, 22, 42, 52, 54]. However,

Therefore, our effort aims to solve the complexities inherent in this technological revolution and provide insights to inform strategic decision-making and policy formulation in an era of unprecedented change.

Our investigation examines various methodologies, ranging from traditional econometric models to cutting-edge reinforcement learning techniques tailored for decision-making agents. Agent-Based Simulation (ABS), Input-Output Analysis, Surveys and Interviews, Scenario Analysis, Policy Analysis, and the Delphi Method all feature prominently, each offering unique insights into the intricate dynamics entwined with the proliferation of generative AI. They are synthesizing insights gleaned from these methodologies. Recognizing the nuanced interplay between technological advancement and its societal ramifications, we argue that such an integrative approach is essential for comprehensively understanding the transformative effects of generative AI.

Moreover, by shedding light on the multifaceted consequences of AI innovation, our research aims to facilitate informed decision-making and policy formulation in the face of unprecedented technological change. Through this integrative lens, we aspire to contribute to a deeper comprehension of the societal implications of AI innovation, empowering

Abstract — Digital transformation (DT) is about change in every aspect of the organization, but fundamental technologies are the core of this conversion. In this paper, modern technologies, mostly Artificial Intelligence (AI), is studied. Also, the impact of AI in creating value for companies has been investigated. It also argues that the firms which accept these changes as opportunities will succeed in the digital age. In this research, by applying the literature review methodology, it was found that AI can enhance the customer experience. It expands the number of sales and enables real-time decision making.

Keywords – artificial intelligence, digital transformation, digital technology, value creation, organizational barriers.

I. INTRODUCTION

Nowadays, in the digital era, disruption is happening everywhere, and for surviving, businesses must learn to see things differently, do things differently and deliver things differently [1]. They need to use digital innovations in their processes, structures, procedures, values, products, assets to manage risk and threats and improve efficiency and customer experience [2]. This process is called digital transformation. It consists of many building blocks in an organization: digital technologies, Disruptions, Strategic responses, Changes in value creation paths, Structural changes, Organizational barriers, challenges, and Positive impacts. Digital technology plays a crucial role in digital transformation because it is the core of this process [3].

for a new digital age. Also, this research helps them to understand how it can improve customer experiences through AI.

This paper is structured as follows. In section II, the impact of technology on the value chain and organizational performance is presented. Then in section III, the building blocks of DT is defined, and in section IV, trends in digital technology and AI are presented. The effects of AI on value creation for companies are then discussed. In the next section, we describe the organizational barriers to adopting AI in the organization and its positive and negative effect. Finally, several case studies related to the topic are reviewed.

II. IMPACT OF TECHNOLOGY

A. Exponential Evolution of Technology

In recent years, digital technology has evolved fast and has progressed exponentially. Three fundamental laws explain the exponential growth in processing, communication and storage. According to Moore's law, every 18 months, we can have twice the data processing power. The second law is called Butter's law, and it says every nine months, the amount of data communicated doubles. The other law is Kryder's law which says the amount of data stored in a hard drive will double every 13 months [7]–[10]. Therefore, this growth makes digital innovations faster,

- RPA is not AI
- RPA may be integrated with AI
- AI may help redesign processes

Abstract — Robotic process automation (RPA) is the use of software with artificial intelligence (AI) and machine learning capabilities to handle high-volume, repeatable tasks that previously required only humans to perform. In short, there is at least a problem with traditional Business Process Management (BPM) systems, as they cannot suggest the best combination of tasks, people and timings, which can increase the benefits of running them, while reducing the costs and risk factors. Yet, it is an irrefutable fact that the current business environment is highly dynamic. On the one hand, we need to be more efficient to execute what is operational and obvious, releasing scarce resources for more critical areas. Then, dealing with business process management and automation, a common claimed benefit is associated with the improvement of performance. In addition to this and other potential benefits, we also highlight some potential operational risks from the adoption of AI-based systems like RPA. The acceleration in the business context makes it more difficult to predict what changes will occur and how they can affect the technological solutions used in the increasingly automated business processes. We point out the fact that immature or not well-trained models can eventually decrease productivity and increase errors from unsupported or even wrong decisions. We present a case study in the banking sector, which illustrates some examples of benefits and risks arising from BPM solutions that use AI-related agents/artifacts.

Keywords - Business Process (BP); Business Process Management (BPM); Business Process Automation (BPA); Robotic Process Automation (RPA); Artificial Intelligence (AI).

growing dynamism of business environments, BP are redesigned and/or reengineered as a response to those external transformations or even because companies want to be operating with more agility.

Business Process Management (BPM) is a relevant topic focused on managing organizational processes using different methods, techniques and software solutions to analyze, control and manage tasks and organizational activities, using assets like people, skills, applications, documents and other related data and information [22].

An identified problem of current BPM solutions is that they do not leverage the amount of data to create insights to solve the most challenging aspects of a BPM System, what task to execute, When the task should be completed (SLA) and by Whom the task should be made. These 3Ws has been usually defined by Process Managers, with tiny or any contribution of a learning mechanism that could increase the probability of a best outcome. So, they cannot suggest the best combination of tasks, people and timings in order to increase the benefits of running them, while reducing transaction costs and associated risks. [25][26]

Nowadays, either researchers and practitioners propose that BP must be gradually optimized and automated. In extending the scope and sophistication of automation, some pertinent questions arise, such as: (1) What are the main benefits and risks associated with new solutions that deepen BP automation with greater "intelligence" in BPM? (2) Is an automated and intelligent mechanism more appropriate to define and decide

AI User Archetype Model

Carlos J. Costa ¹[0000-0002-1037-0561]

¹ ISEG, Universidade de Lisboa, Lisboa, Portugal

² cjcosta@iseg.ulisboa.pt

Abstract. The rapid development of AI technologies has resulted in diverse interactions between users and AI systems. This paper introduces an AI User Archetype Model, classifying users based on their AI literacy, engagement levels, motivations, and governance. The model provides a structured approach to understanding users' behavior, enabling the design of AI systems that align with user needs and enhance AI democratization. The archetypes include The Sage, The Warrior, The Creator, The Producer, and others, each representing a unique combination of these dimensions. This model can be used to optimize AI product design, inform AI education strategies, and guide policy-making for more inclusive AI development.

Keywords: Artificial Intelligence, Gamification, GenAI, User Archetype

1 Introduction

There is a need to explore AI users, why they interact with AI daily, and how AI technologies have resigned themselves. There are user systems developed for AI thinkability-around-and-user engagement. Thus, fully understanding their differences would be instrumental in delivering AI systems that suit user needs and broaden their basis. Further reflections on this attempt to characterize the AI user elucidate their engagement with AI systems. Besides, it explores in detail the most dominant dimensions of user engagement with AI, indicating how users relate and interact with these technologies. The research reported in this paper aims to illuminate a particular model that categorizes AI users based on their literacy, engagement, motivations, and governance while establishing a comprehensive and broad-source framework for user-centered AI design. The methodological approach consisted of a multidimensional analysis of AI users. The proposed factors are selected according to four main dimensions: AI literacy, level of engagement, motivation, and governance. User archetypes are formed from multidimensional analyses: this may lend itself well to the differences in users' relationships

ABSTRACT

Political communication in social media has gained increasing importance in the last years. In this study, we analyze the political parties' communication on Twitter and understand the sentiment of their communication. First by identifying their communication performance regarding the daily number of tweets, favorite tweets, number of retweets per day and per political party. We present a sentiment analysis by the political party using tweets data. In this study, we propose an explanatory model with the main drivers of retweets. To conduct this study, our approach used data analysis and machine learning techniques methods. Results indicate the main determinants that influence future retweets of political posts globally. Here we present a comparison of the communication content between tweets posts and the political parties' programs available on their institutional websites. We identify the similarities between tweets and formal programs per party and among all parties. This study contributes to analyze the coherence and effectiveness of the political parties' communication.

1 INTRODUCTION

Political parties are increasingly using social media to communicate their values and ideas. An example of such behavior was when Barack Obama's staff successfully used Twitter in the 2008 presidential elections [13]. This practice persisted in Donald Trump's administration in 2016 [14]. However, using social media is not a panacea *per se*. It is also essential to analyze what is the effectiveness of what is being communicated to the public. The cohesion between parties' political agenda versus their social media communication needs to be addressed [27]. Are parties communicating according to their goals, or is it all part of a hype machine? [16] The usage of social media in a political context has been studied by several authors [6, 7, 13, 14]. In this context, the evolution in natural language processing and sentiment analysis is significant. Nevertheless, there is a research gap in the Portuguese language and its application in a political context as well [15]. The purpose of the work performed in this paper is to analyze political parties' communication, expressed explicitly by the official Twitter accounts of such parties. To reach this main goal, we state four research objectives (RO) as follows: RO1: Identify the performance of each political party on Twitter; RO2: Identify the global sentiment per political party in Twitter communication; RO3: Identify the drivers of retweet behavior in political parties; RO4: Understand the similarities between social media communication and political program communication.

We used data analysis and machine learning techniques described in section 3 of this paper for each of these research objectives. This study contributes to a better understanding of how political parties communication in Twitter can be analyzed in terms of the sentiment of posts, and globally we contribute to analyze the coherence and effectiveness of the political parties communication.

Resumo - A inteligência artificial (IA) tem nos últimos tempos assumido um papel relevante nos mais diversos setores da nossa sociedade. Estamos num ponto sem retorno, e o nosso futuro passará naturalmente pela incorporação da inteligência artificial, na nossa vida diária, seja profissional, seja pessoal. A ideia da existência de máquinas "pensantes" e que tomem decisões pelos Humanos levanta uma série de questões éticas que devem estar presentes aquando do desenvolvimento e incorporação da inteligência artificial nos mais diversos setores da sociedade. É fundamental estudar e investigar as melhores abordagens à sua implementação, os principais princípios informáticos e sistemas de le sistemas inteligentes e resultados de um estudo dos os principais grupos de M e IEEE pela comunidade

Por exemplo, os algoritmos que recomendam com base em determinados critérios a aprovação ou não da hipoteca [1]–[4]. E, se a rejeição acontece baseada em discriminação racial? E, os algoritmos que são incorporados nas viaturas de condução autónoma e que tomam decisões perante determinadas situações. E, se for inevitável o choque frontal com um conjunto de pessoas? Qual, ou quais as que escolhe para esse choque? Baseia a sua decisão na idade? Na raça? [1]. A IA assume também um papel relevante na educação. Por exemplo, no reconhecimento da aquisição de competências [5]–[7]. Que os algoritmos de inteligência artificial representam um papel importante e crescente na nossa sociedade, é uma realidade. Os cenários acima descritos, são assustadores, por isso, a importância crescente de desenvolver algoritmos de inteligência artificial, que não sejam apenas poderosos e escaláveis, mas acima de tudo, que sejam transparentes para inspeção. Por outro lado, é fundamental que os algoritmos sejam robustos o suficiente de forma a evitar a manipulação.

Os novos desafios éticos que se colocam atualmente na inteligência artificial, estão relacionados com o facto de os algoritmos de IA serem utilizados para tarefas com dimensões sociais – cognitivas anteriormente realizada por Humanos. Neste caso, os algoritmos herdam requisitos sociais [1]. Nesse sentido, perceber o impacto que a utilização da IA nas organizações e nas vidas das pessoas tem é fundamental. Mas, principalmente identificar os princípios éticos dessa aplicação e como os podemos monitorizar e agir. Nesse sentido, este artigo identifica os principais desafios éticos relativos à utilização da inteligência artificial. A abordagem metodológica seguida neste artigo seguiu o método de estudo documental e bibliométrico para identificar as diversas áreas cobertas na literatura que incluem estudos relacionados com ética e inteligência artificial, nomeadamente nas duas principais bibliotecas digitais da área das ciências da

Abstract: The democratization of artificial intelligence (AI) involves extending access to AI technologies beyond specialized technical experts to a broader spectrum of users and organizations. This paper provides an overview of AI's historical context and evolution, emphasizing the concept of AI democratization. Current trends shaping AI democratization are analyzed, highlighting key challenges and opportunities. The roles of pivotal stakeholders, including technology firms, educational entities, and governmental bodies, are examined in facilitating widespread AI adoption. A comprehensive framework elucidates the components, drivers, challenges, and strategies crucial to AI democratization. This framework is subsequently applied in the context of scenario analyses, offering insights into potential outcomes and implications. The paper concludes with recommendations for future research directions and strategic actions to foster responsible and inclusive AI development globally.

https://sustentix.sapo.pt/quais-as-principais-riquezas-da-gronelandia/?utm_source=SAPO_HP&utm_medium=web&utm_campaign=destaques
- ChatGPT said:
- O artigo "Porque é a Gronelândia cobiçada? A culpa é do degelo que dá acesso a ..." aborda a crescente atenção internacional sobre a Gronelândia devido ao aquecimento global, que está facilitando o acesso aos seus vastos recursos naturais. Com o degelo das camadas de gelo, tornam-se mais acessíveis depósitos de metais de terras raras, como neodímio, prasodímio, disprósio e térbio, além de minérios de ferro, ouro e rubi. Adicionalmente, há vastas reservas de gás e petróleo que podem ser exploradas.
- O artigo também destaca a importância geopolítica da região, mencionando o interesse dos Estados Unidos, que já abriram um consulado na Gronelândia e mantêm uma base aérea no norte da ilha. O degelo não só facilita a exploração de recursos, mas também abre novas rotas marítimas, o que pode alterar significativamente as dinâmicas comerciais e estratégicas globais.
- A análise do artigo revela um tom factual e informativo, apresentando dados e opiniões de especialistas sobre as oportunidades e desafios decorrentes das mudanças climáticas na Gronelândia. Embora o texto aborde as potencialidades econômicas e estratégicas, também sugere uma preocupação subjacente com as implicações ambientais e geopolíticas associadas ao degelo e à exploração dos recursos naturais da região.
- You said:
- describe interns of positive or negative sentiment.
- ChatGPT said:
- The sentiment of the article is neutral to slightly negative.
- Neutral aspects: The article presents a factual and informative perspective on the natural resources of Greenland and the geopolitical interest in the region. It discusses the economic and strategic opportunities in a straightforward manner.
- Slightly negative aspects: The underlying concern about climate change and the environmental consequences of the melting ice adds a negative tone. While the economic potential is highlighted, the mention of geopolitical tensions and environmental impact suggests a cautious or critical perspective.
- Overall, the article does not express strong positivity or negativity but leans slightly negative due to concerns about climate change and resource exploitation.

Business Strategy & Decision-Making

Usage: Analyzing competitive strategies and decision-making frameworks.

Prompt:

"Compare the competitive strategies of Porter's Five Forces and Blue Ocean Strategy, providing examples of companies that have successfully implemented them."

Economic Analysis & Policy Recommendations

Usage: Assessing economic policies and their implications.

Prompt:

- *"Analyze the potential economic impact of an increase in the minimum wage in the European Union. Discuss both short-term and long-term effects."*

Market Research & Consumer Behavior

Usage: Understanding consumer trends and behaviors.

Prompt:

- *"What are the main factors influencing consumer purchasing decisions in e-commerce, and how do companies use behavioral economics to increase sales?"*

Operations & Supply Chain Management

- **Usage: Optimizing supply chain efficiency.**
- **Prompt:**
- "Discuss how Just-in-Time (JIT) inventory management can improve efficiency and reduce costs in manufacturing. What are the risks associated with this approach?"

Game Theory & Strategic Interaction

Usage: Applying game theory to business and economics.

Prompt:

- *"Explain the concept of the Nash Equilibrium in game theory. How does it apply to pricing strategies in oligopolistic markets?"*

Data-Driven Decision-Making

Usage: Using data for business insights.

Prompt:

- *"How can businesses use regression analysis to predict sales trends? Provide an example with key variables that should be considered."*
