Flask

web development,
one drop at a time

Carlos J. Costa (ISEG)

Flask

- Flask is a microframework for Python
- is a lightweight WSGI web application framework
- began as a simple wrapper around Werkzeug and Jinja
- Created by Armin Ronacher
- BSD licensed
- <https://palletsprojects.com/p/flask/>

Werkzeug

- utility library for Python
- toolkit for Web Server Gateway Interface (WSGI) applications,
- licensed under a BSD License. Werkzeug
- can realize software objects for request, response, and utility functions.
- Python 2.7 and 3.5 and late
- <https://palletsprojects.com/p/werkzeug/>

Jinja

- is a template engine for the Python
- is licensed under a BSD License.
- similar to the Django web framework
- it handles templates in a sandbox.
- <https://palletsprojects.com/p/jinja/>
- <https://github.com/pallets/jinja>

Flask Application (ex01)

```
from flask import Flask  
app = Flask(__name__)  
@app.route('/')  
def hello_world():  
    return 'Hello, World!'  
if __name__ == "__main__":  
    app.run()
```

Flask Application

```
#import Flask class
from flask import Flask
#create object app
app = Flask(__name__)
# use the route() decorator to tell Flask what URL should
# trigger our function
@app.route('/')
#The function is given a name which is also used to
# generate URL
def hello_world():
    return 'Hello, World!'
# The global variable, __name__, in the module that is the entry point to your program, is '__main__'.
# Otherwise, it's the name you import the module by. So, code under the if block will only run if the
# module is the entry point to your program. It allows the code in the module to be importable by other
# modules, without executing the code block beneath on import.
if __name__ == "__main__":
    app.run()
```

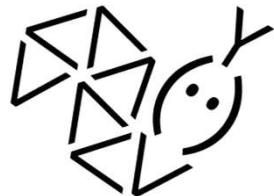

Flask Application

- Save in a folder flask_app.py
- Call:
python flask_app.py
- In the browser:
localhost:5000

Alternatives

pythonanywhere

bitnami

| WikiWikiWeb.de |

Routing

- Use the route() decorator to bind a function to a URL.

```
@app.route('/')
def index():
    return 'Index Page'
```

```
@app.route('/hello')
def hello():
    return 'Hello, World'
```

Routing (ex02)

```
from flask import Flask  
app = Flask(__name__)  
@app.route('/')  
def hello_world():  
    return 'Hello, World (in index page)'  
@app.route('/hello')  
def hello():  
    return 'Hello, World (in hello page)'  
if __name__ == "__main__":  
    app.run()
```

Static Files

- Dynamic web applications also need static files.
- E.g. CSS and JavaScript
- Create a folder called in the package or next to the module
/static

```
url_for('static', filename='style.css')
```

Rendering Templates

- Flask configures the Jinja2 template engine automatically
- To render a template use the `render_template()` method
- Example:
 - /flask_app.py
 - /templates
 - /hello.html

Rendering Templates

/flask_app.py
/templates
/hello.html

```
from flask import render_template  
  
@app.route('/hello/')  
@app.route('/hello/<name>')  
def hello(name=None):  
    return render_template('hello.html', name=name)
```

```
<!doctype html>  
<title>Hello from Flask</title>  
{% if name %}  
    <h1>Hello {{ name }}!</h1>  
{% else %}  
    <h1>Hello, World!</h1>  
{% endif %}
```

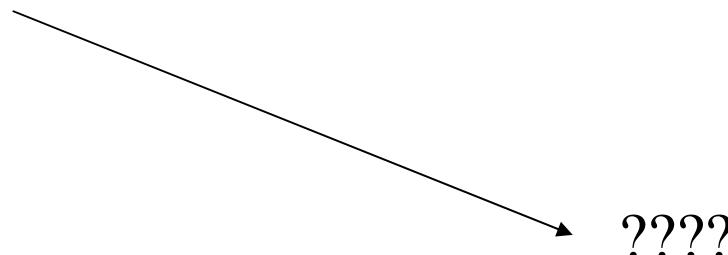

Rendering Templates (ex03)

/flask_app.py

/templates

/form.html

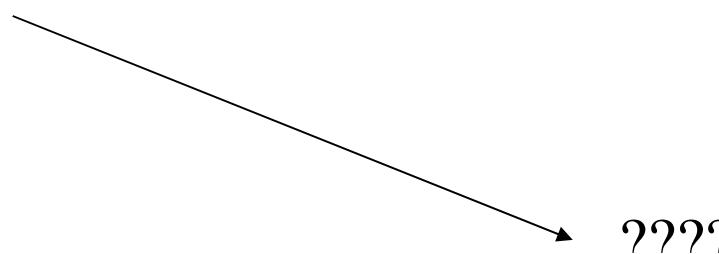

Rendering Templates (ex03)

/flask_app.py

/templates

/form.html

Rendering Templates (ex03)

/flask_app.py

/templates

/form.html

Rendering Templates (ex03)

```
from flask import Flask, render_template
app = Flask(__name__)
@app.route('/')
def render_static():
    return render_template('form.html')
@app.route('/hello')
def hello():
    return 'Hello, World (in hello page)'
if __name__ == "__main__":
    app.run()
```

flask_app.py
File

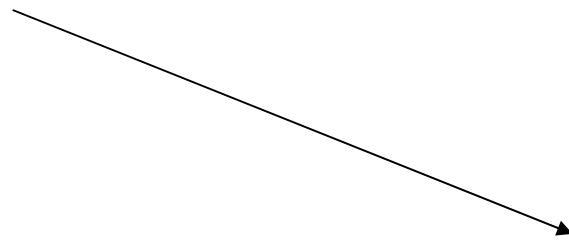

Rendering Templates (ex03)

/flask_app.py

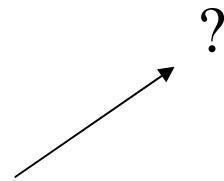

/templates

/form.html

Rendering Templates (ex03)

```
<html>
  <body>
    <form action = "/save/" method = "POST">
      <p>author <input type = "text" name = "Author" /></p>
      <p>phrase <input type = "text" name = "Phrase" /></p>
      <p><input type = "submit" value = "submit" /></p>
    </form>
  </body>
</html>
```

form.html
File

Rendering Templates (ex03)

```
<html>
  <body>
    <form action = "/save/" method = "POST">
      <p>author <input type = "text" name = "Author" /></p>
      <p>phrase <input type = "text" name = "Phrase" /></p>
      <p><input type = "submit" value = "submit" /></p>
    </form>
  </body>
</html>
```

form.html
File

HTTP Methods

- Web applications use different HTTP methods when accessing URLs.
- By default, a route only answers to GET requests.
- use the methods argument of the route() decorator to handle different HTTP methods.

HTTP Methods

```
from flask import request
```

```
@app.route('/login', methods=['GET', 'POST'])
def login():
    if request.method == 'POST':
        return do_the_login()
    else:
        return show_the_login_form()
```

Rendering Templates (ex04)

```
from flask import Flask, render_template, request  
app = Flask(__name__)  
@app.route('/')  
def render_static():  
    return render_template('form.html')  
@app.route('/save/', methods=['GET', 'POST'])  
def hello():  
    return 'Hello!!!'  
if __name__ == "__main__":  
    app.run()
```

New
flask_app.py
File

Save Data (ex05)

```
from flask import Flask, render_template, request
app = Flask(__name__)
@app.route('/')
def render_static():
    return render_template('form.html')
@app.route('/save/', methods=['GET', 'POST'])
def index():
    data = request.form['Author'] + " - " + request.form['Phrase']
    fo = open("test1.txt", "a+")
    fo.write(data + "\n")
    fo.close()
    return "thank you"
if __name__ == '__main__':
    app.run(debug = True)
```

flask_app.py
File

Tiny App (ex06)

/flask_app.py

/templates

/form.html

/index.html

Tiny App (ex06)

```
from flask import Flask, request, render_template
app = Flask(__name__)
@app.route('/save/', methods=['GET', 'POST'])
def write():
    data = request.form['Author'] + " - " + request.form['Phrase']
    fo = open("test1.txt", "a+")
    fo.write(data + "\n")
    fo.close()
    return render_template('index.html')
@app.route('/read/')
def read():
    fo = open("test1.txt", "r")
    data1 = fo.read()
    fo.close()
    return data1
@app.route('/')
def render_static():
    return render_template('form.html')
if __name__ == '__main__':
    app.run(debug=True)
```

flask_app.py
File

Tiny App (ex06)

```
<html>
  <body>
    <form action = "/save/" method = "POST">
      <p>author <input type = "text" name = "Author" /></p>
      <p>phrase <input type = "text" name = "Phrase" /></p>
      <p><input type = "submit" value = "submit" /></p>
    </form>
  </body>
