NumPy

Prof. Carlos J. Costa, PhD

Learning Objectives

- Understand what is NumPy
- Know the main features of Numpy
- Solve mathematical problems using NumPy

Numpy

- Numerical Python
- Is an open-source Python library
- Is a fundamental Python library for scientific computing.
- Provides array related functionality
- Has higher level of performance

arr

1	2	3	4	5
---	---	---	---	---

arr[0] arr[1] arr[2] arr[3] arr[4]

Numpy

```
import numpy as np  
c = np.array([1,2,3,4])  
print(type(c))
```

```
<class 'numpy.ndarray'>
```

Shape, Rank and Size

- The bidimensional array (matrix):

```
b = np.array([[1, 2, 3], [4, 5, 6]])
```

- What information can be obtained about this array:

```
shape = b.shape 2, 3
```

```
rank = np.ndim(b) 2
```

```
size = b.size 6
```

Reshaping arrays

- Reshaping means changing the shape of an array.
- The shape of an array is the number of elements in each dimension.
- By reshaping we can add or remove dimensions or change number of elements in each dimension

```
import numpy as np  
arr = np.array([4, 4, 3, 4, 5, 6, 7, 9, 0, 10, 17, 12])  
newarr = arr.reshape(3, 4)  
print(newarr)
```

```
[[ 4 4 3 4]  
 [ 5 6 7 9]  
 [ 0 10 17 12]]
```

Access an Array Element

- Change value to array:

```
a [2]=50
```

```
print(a)
```

Array with Zeros Only

- Create an array with zeros only

```
a = np.zeros( (2, 2) )  
print(a)
```

Array with Only “ones”

- Create array with only “one”

```
b = np.ones( (1, 2) )  
print(b)
```

$$I_1 = [1],$$

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}.$$

$$I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix},$$

Identity Array

- create 3x3 identity array

```
d = np.eye(3)  
print(d)
```

.....,

$$I_n = \begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ .. & .. & .. & .. & .. & .. \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

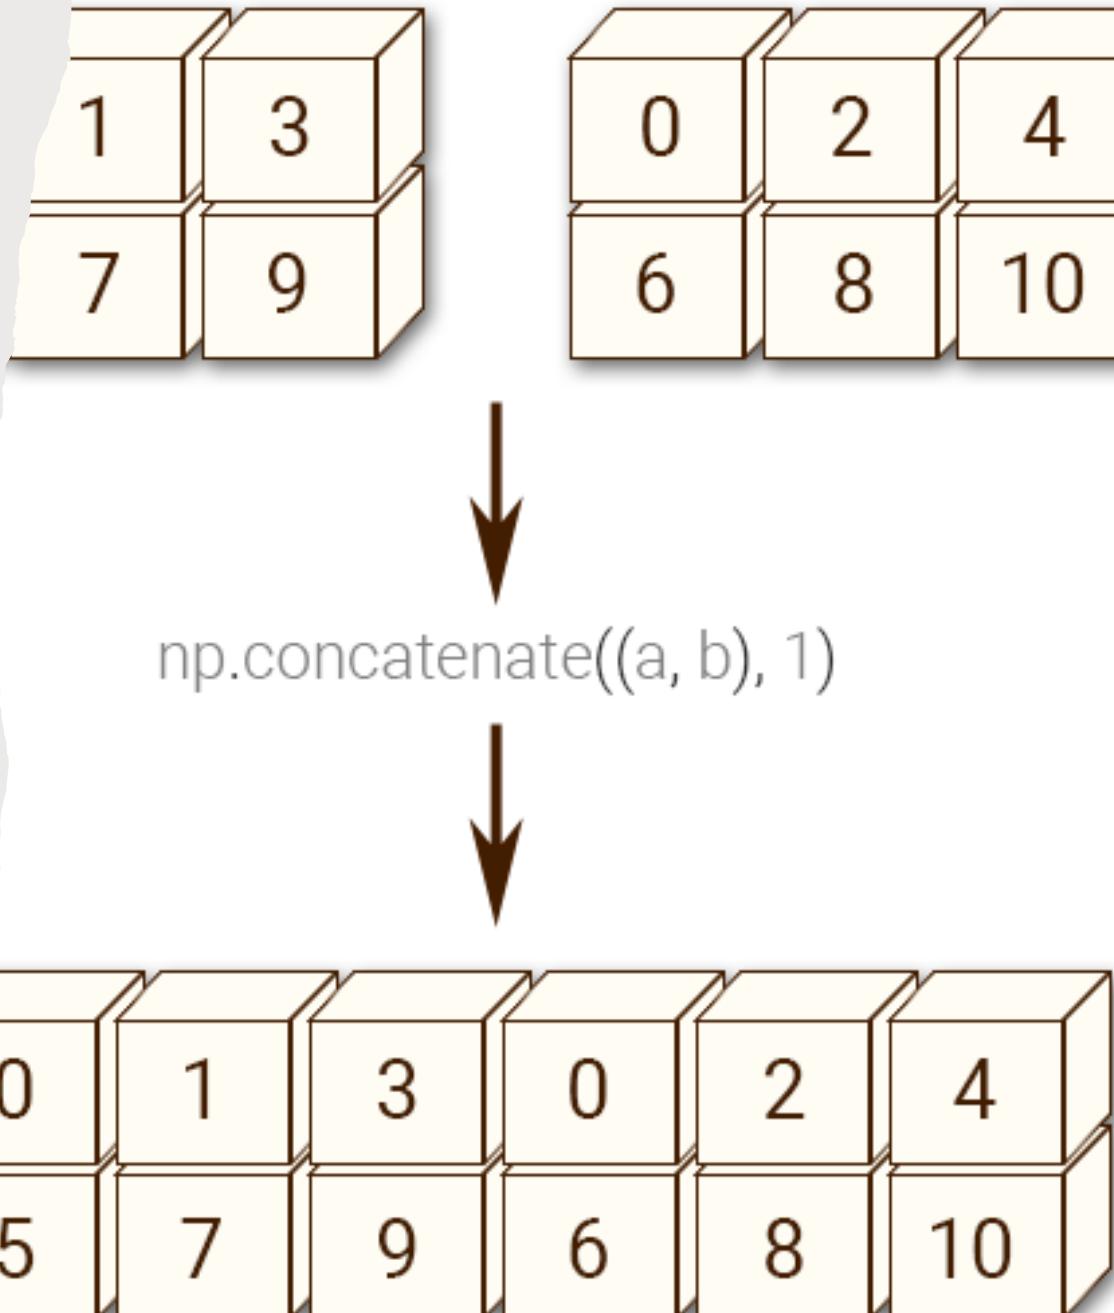

Joining NumPy Arrays

- putting contents of two or more arrays in a single array.
- In SQL we join tables based on a key, whereas in NumPy we join arrays by axes.

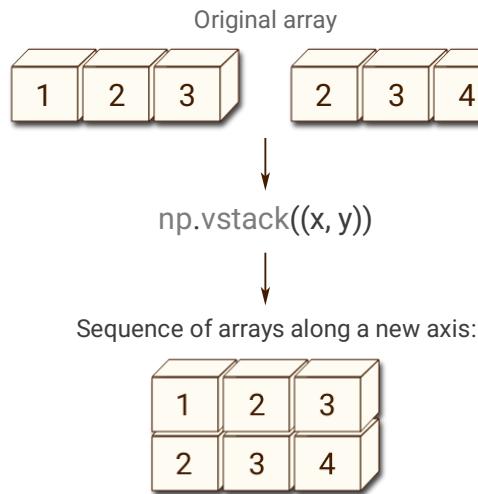

Concatenation

- We pass a sequence of arrays that we want to join to the `concatenate()` function, along with the axis.
- If axis is not explicitly passed, it is taken as 0.

```
import numpy as np  
arr1 = np.array([1, 2,  
3])  
arr2 = np.array([4, 5,  
6])  
arr =  
np.concatenate((arr1,  
arr2))  
print(arr)
```

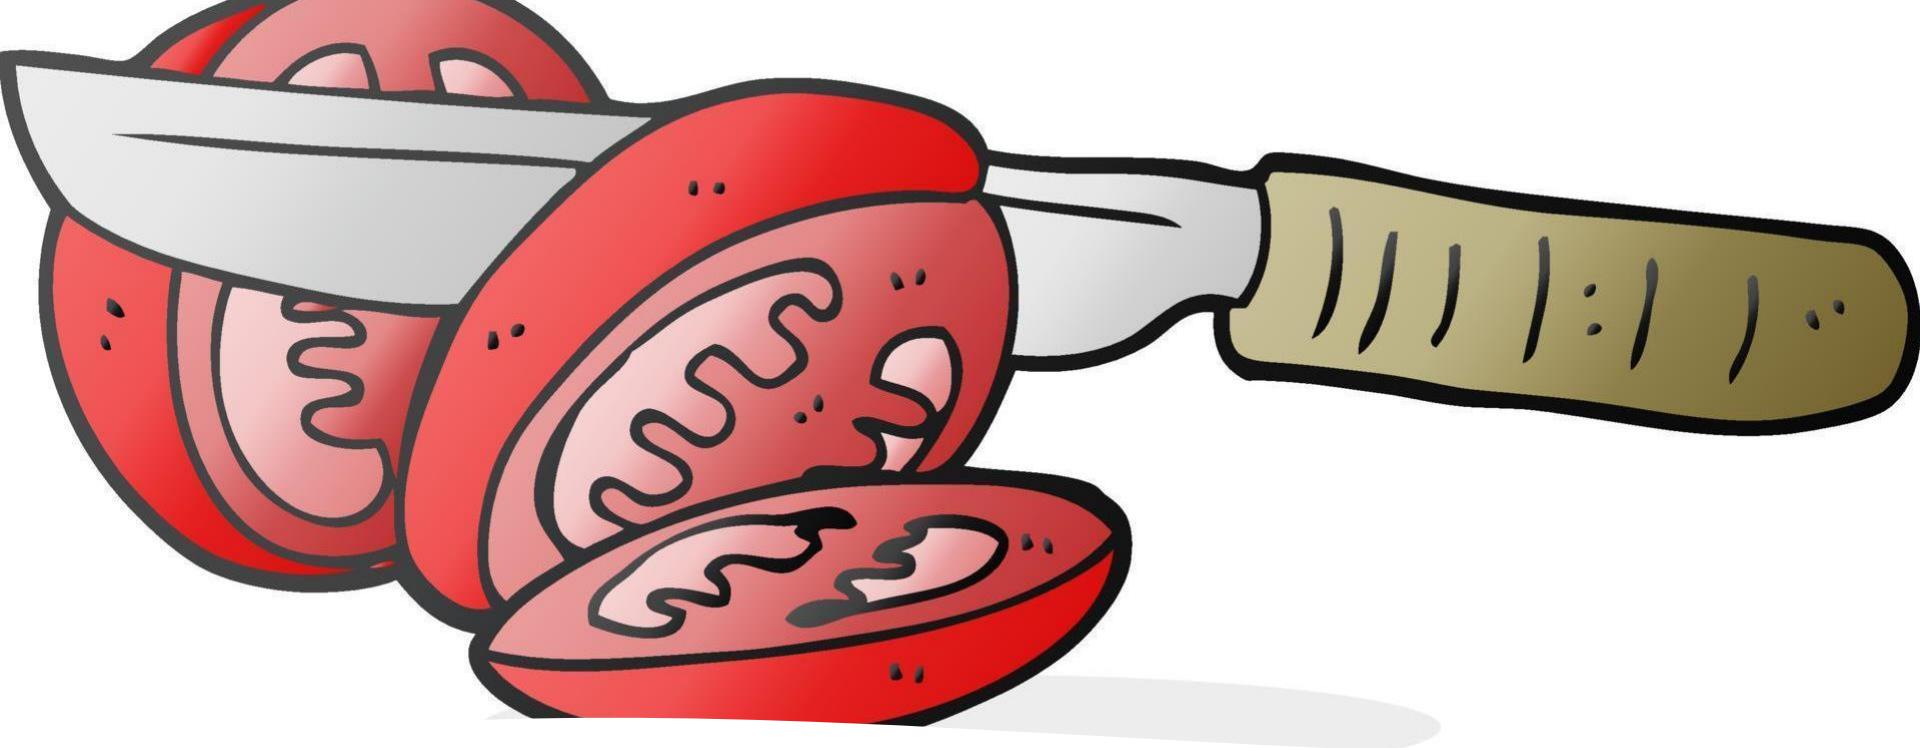

Stacking

- Stacking is same as concatenation
- The only difference is that stacking is done along a new axis.

```
import numpy as np  
arr1 = np.array([1, 2, 3])  
arr2 = np.array([4, 5, 6])  
arr = np.stack((arr1, arr2), axis=1)  
print(arr)
```

```
a = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])  
print(a)
```

Slicing Arrays

```
[[ 1   2   3   4 ]  
 [ 5   6   7   8 ]  
 [ 9  10  11  12 ]]
```

Slicing Arrays

```
a = np.array([[1,2,3,4], [5,6,7,8],  
[9,10,11,12]])
```

```
print(a)
```

```
b = a[:3, 1:3]
```

```
print(b)
```

Slicing Arrays

```
a = np.array([[1,2,3,4], [5,6,7,8], [9,10,11,12]])
```

```
b = a[:3, 1:3]
```

```
print(b)
```

```
[ [ 1  2  3  4 ]  
[ 5  6  7  8 ]  
[ 9 10 11 12 ] ]
```

Slicing Arrays

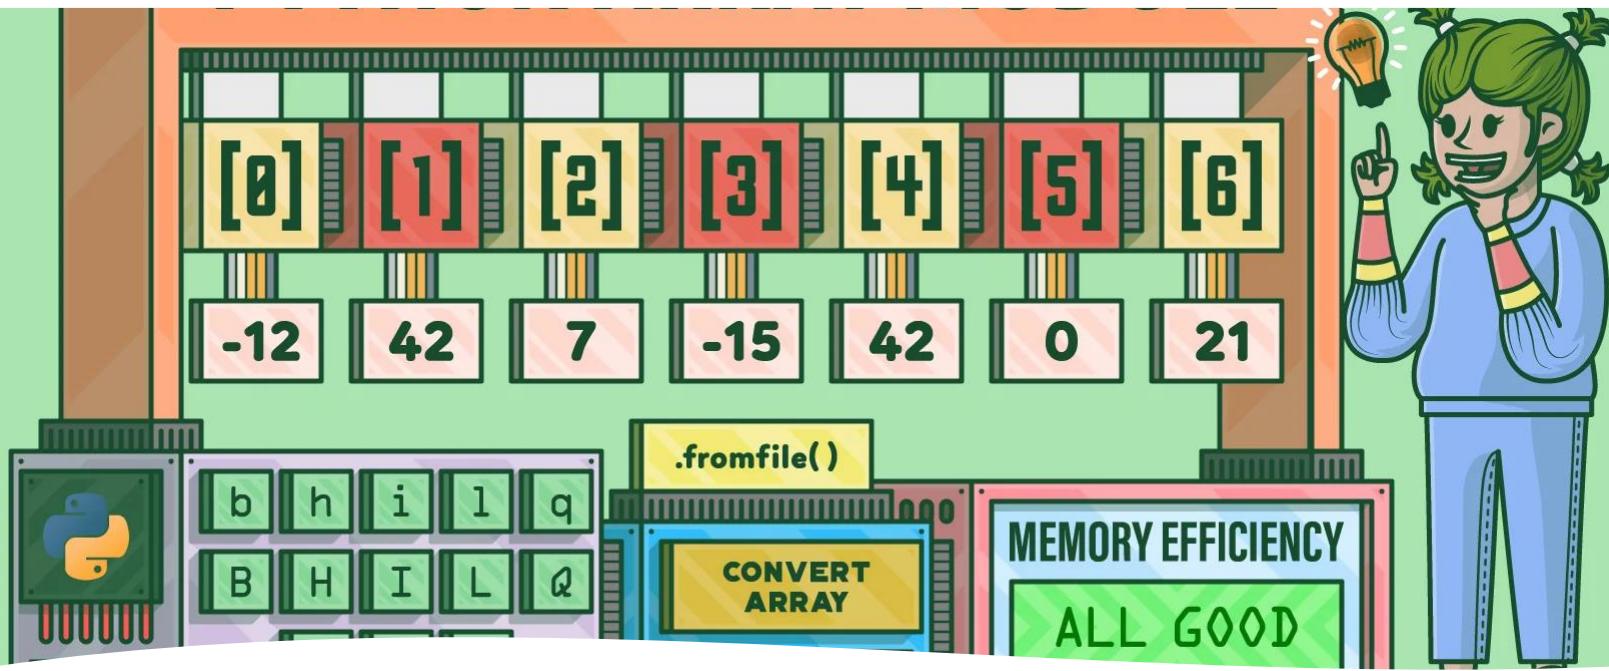

```
b[0, 0] = 99
```

- what happens to array a?

Slicing Arrays

```
b[0, 0] = 99
```

- what happens to array a?
- b = a[:3, 1:3]
- bCopyA= a[:3, 1:3].copy()

Handling Indexes

```
import numpy as np
#create a new array
a = np.array([[1,2,3], [4,5,6], [7,8,9], [10, 11, 12]])
print(a)
```

Handling Indexes

- create an array of indexes

```
b = np.array([0, 2, 0, 1])
```

```
print(a[np.arange(4), b])
```

Handling Indexes

```
a [np.arange(4), b] += 10
```

```
print(a)
```

Handling Indexes

b=1

b+=10

B

b=1

b=b+10

b

Searching Arrays

```
grades = np.array([14, 12, 13, 14, 15, 14, 14])  
x = np.where(grades == 14)
```

```
print(x)
```

Searching Arrays

```
grades = np.array([14, 12, 13, 14, 15, 14, 14])
```

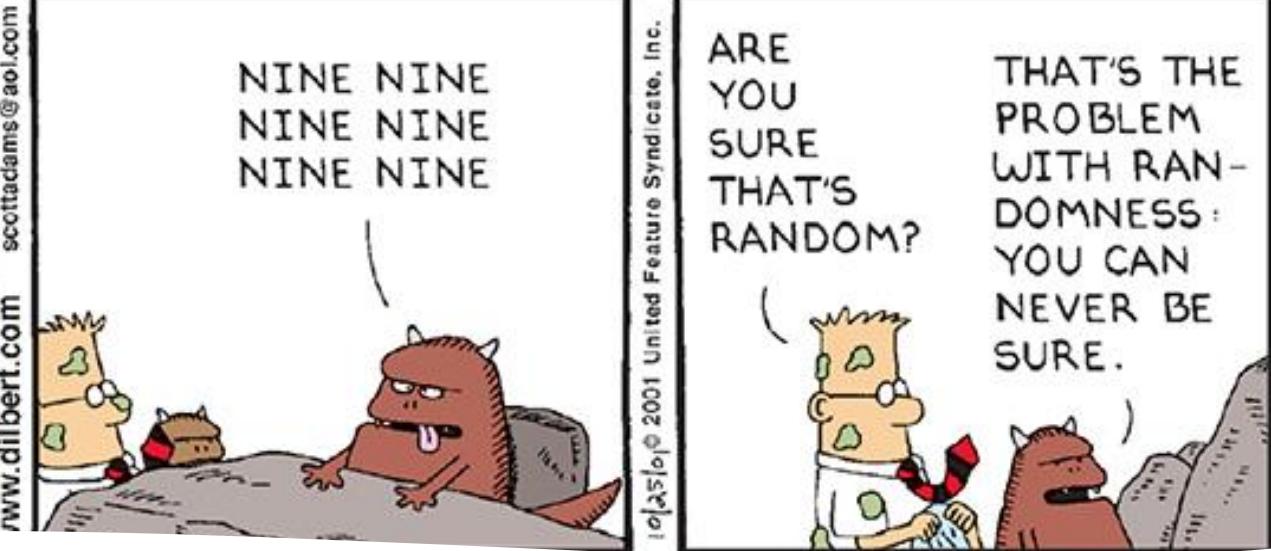

```
x = np.where(grades == 14)
```

```
print(x)
```

```
(array([0, 3, 5, 6], dtype=int64),)
```

TOUR OF ACCOUNTING

OVER HERE
WE HAVE OUR
RANDOM NUMBER
GENERATOR.

Random

Random number does NOT mean a different number every time.

Random means something that can not be predicted logically.

Array filled with random numbers

- Create array filled with random numbers

```
e = np.random.random( (4, 4) )  
print(e)
```

Generate Random Number

NumPy offers the random module to work with random numbers.

```
from numpy import random  
x = random.randint(100)  
print(x)
```

```
from numpy import random  
x = random.rand()  
print(x)
```

Generate Random Array

Array of Integers:

```
from numpy import random  
x=random.randint(100, size=(5))  
print(x)
```

```
from numpy import random  
x = random.randint(100, size=(3, 5))  
print(x)
```

Array of Floats:

```
from numpy import random  
x = random.rand(5)  
print(x)
```

Random Data Distribution

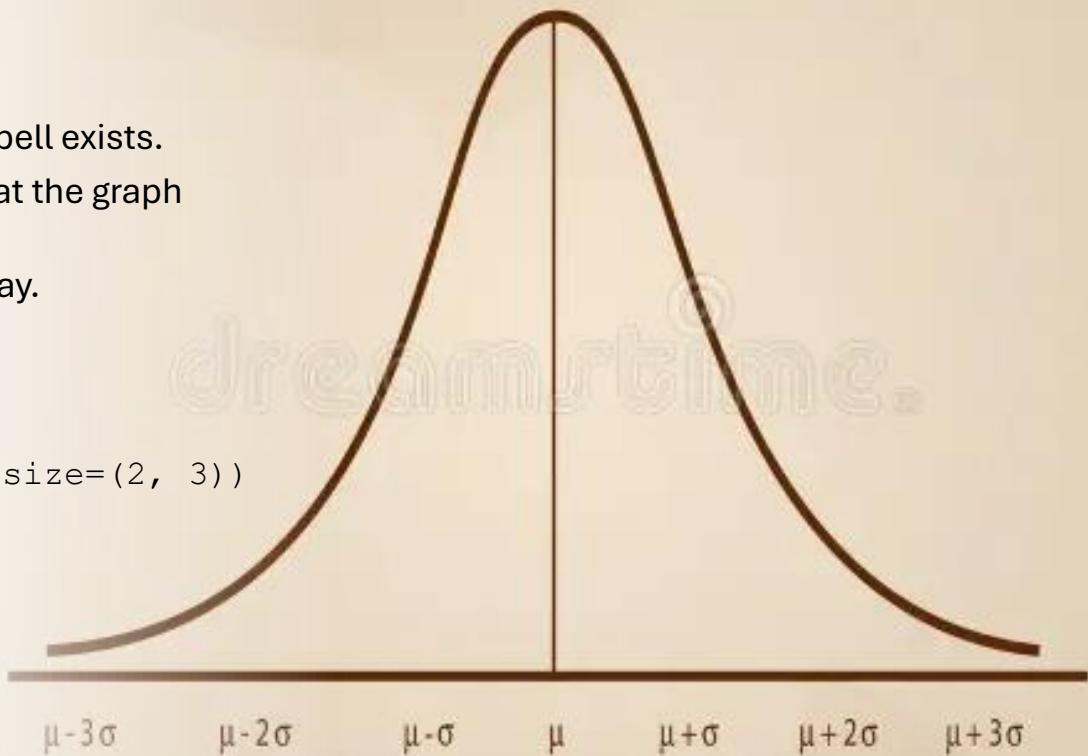

A random distribution is a set of random numbers that follow a certain *probability density function*.

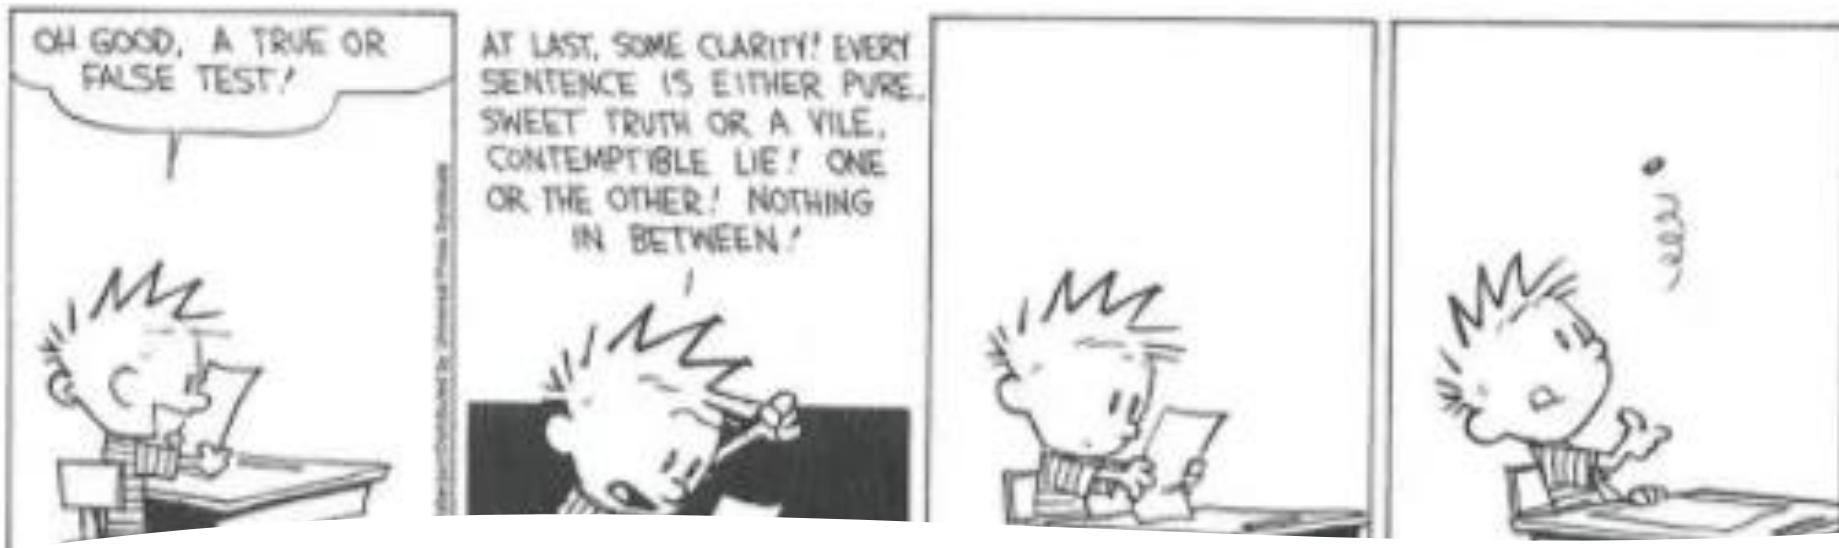

Normal Distribution

random.normal has three parameters:

- loc - (Mean) where the peak of the bell exists.
- scale - (Standard Deviation) how flat the graph distribution should be.
- size - The shape of the returned array.

```
from numpy import random  
x = random.normal(loc=1, scale=2, size=(2, 3))  
print(x)
```

Binomial Distribution is a Discrete Distribution.

- It describes the outcome of binary scenarios, e.g. toss of a coin, it will either be head or tails.

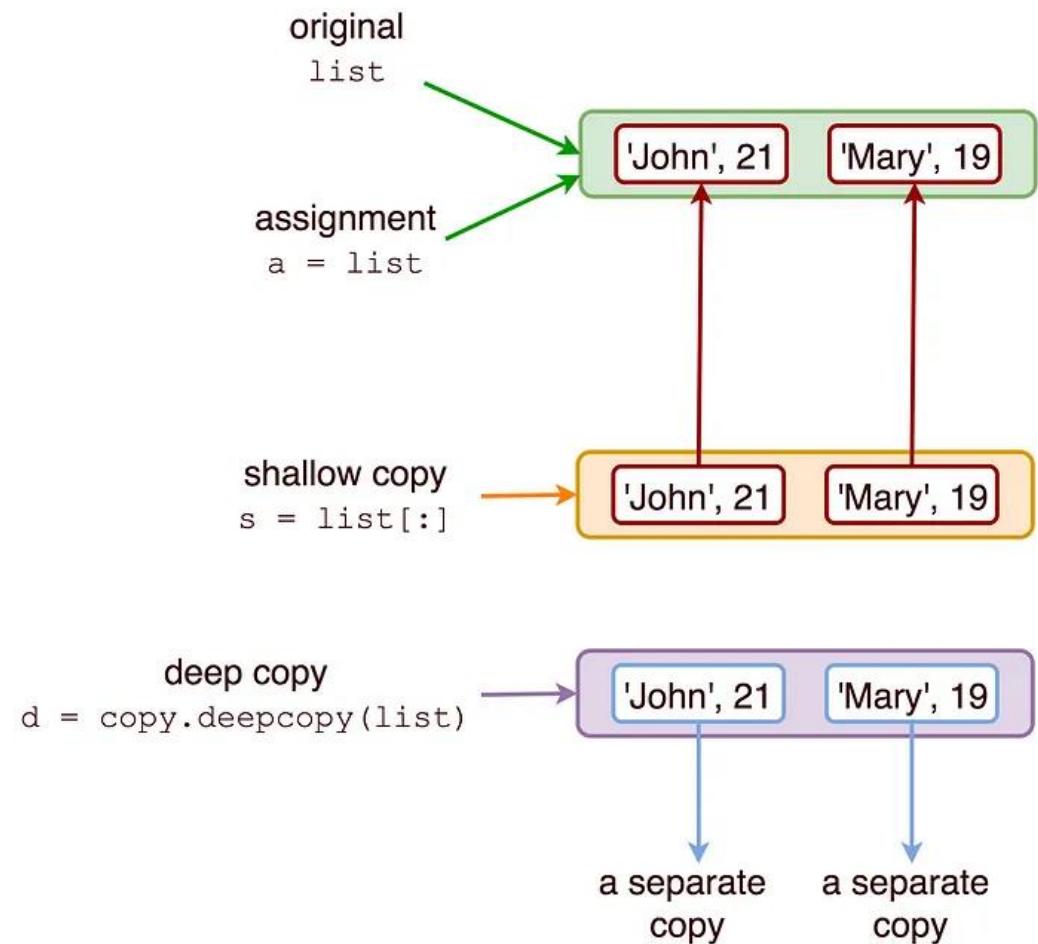

It has three parameters:

- n - number of trials.
- p - probability of occurrence of each trial (e.g. for toss of a coin 0.5 each).
- size - The shape of the returned array.

```
from numpy import random  
x = random.binomial(n=10, p=0.5, size=10)  
print(x)
```

Binomial Distribution

Copy in Python

Conclusions

- NumPy (Numerical Python) is an open source Python library
- Array related functionality, including searches, index handling
