DE LISBOA

# Learning by Doing

- Guess an integer number from the interval 0 to 100.
- The winner is the student whose guess is closest to  $2/3$  times the average of the guesses of all students ...
- ... and gets 10€ (for real!).
- If there are multiple winners, the price will be shared equally.

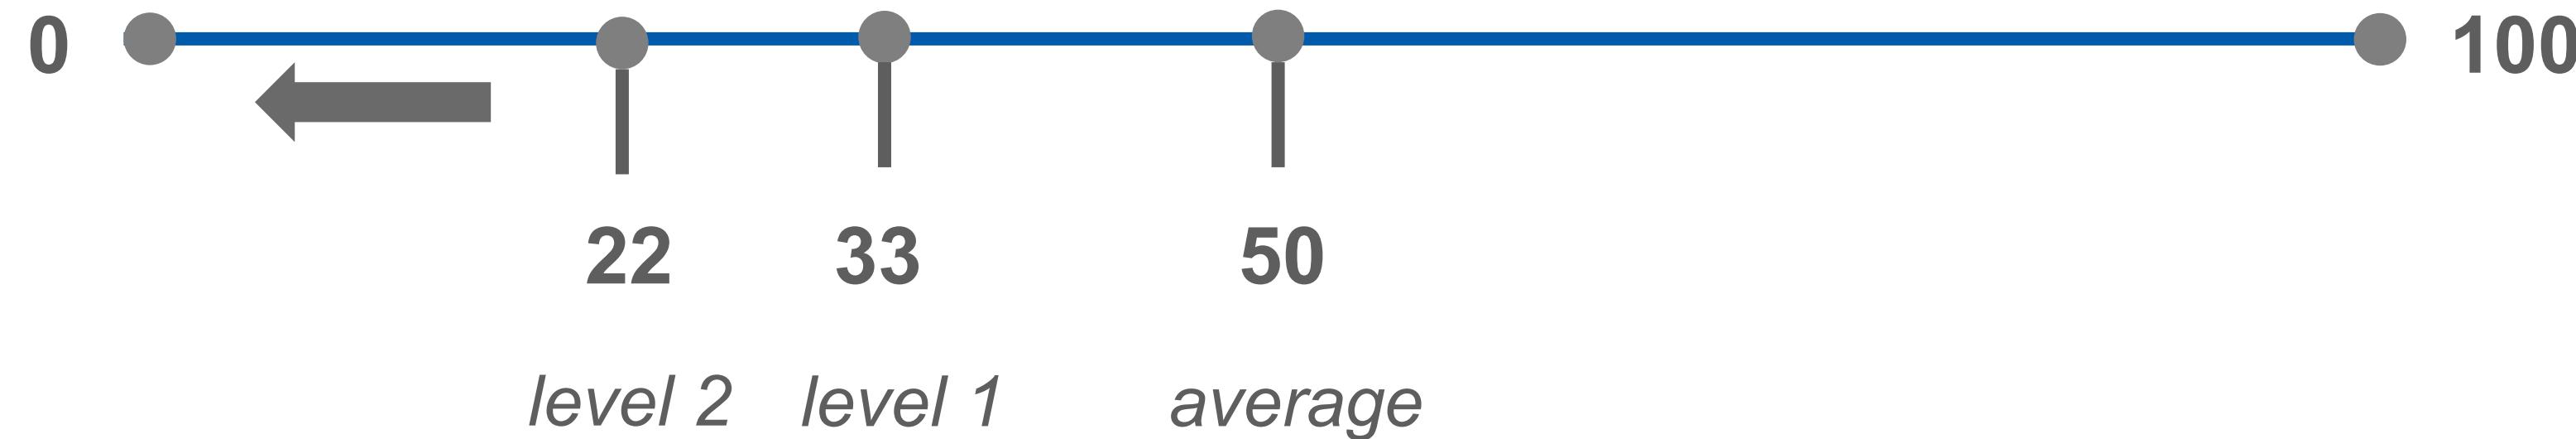

# The game-theoretical solution

- Dominated numbers
- Iterative elimination of dominated numbers → theoretic equilibrium of 0

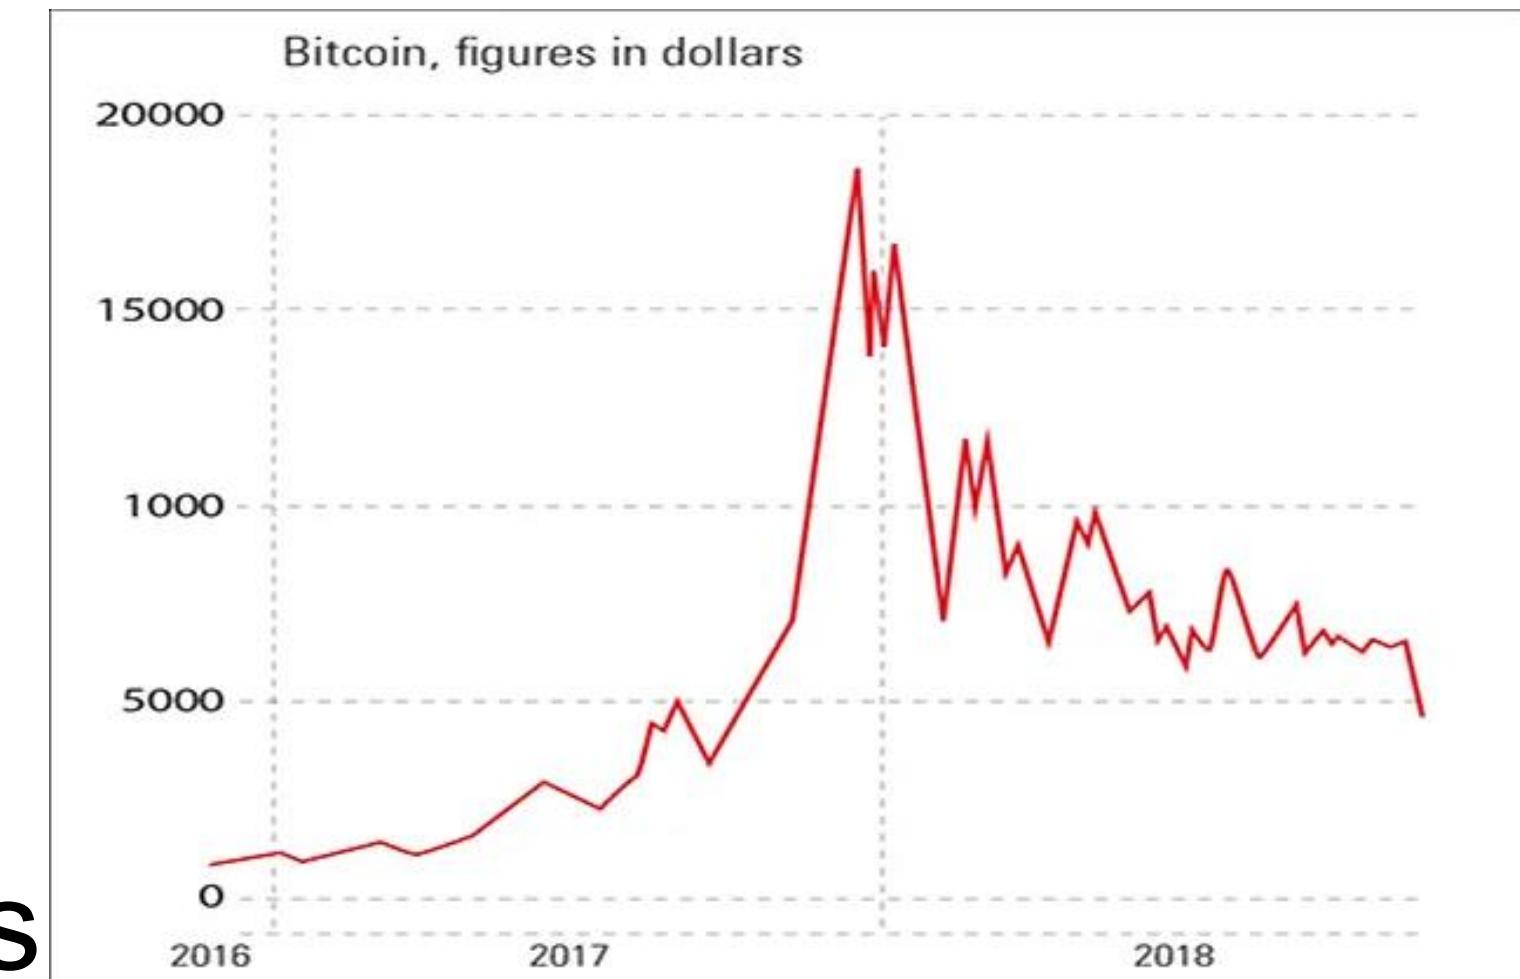

# What happens in experiments?

- Theoretically, equilibrium  $\rightarrow 0$ .
- Empirically, average is not 0  $\rightarrow$  e.g., 23.07 in Camerer (2003).

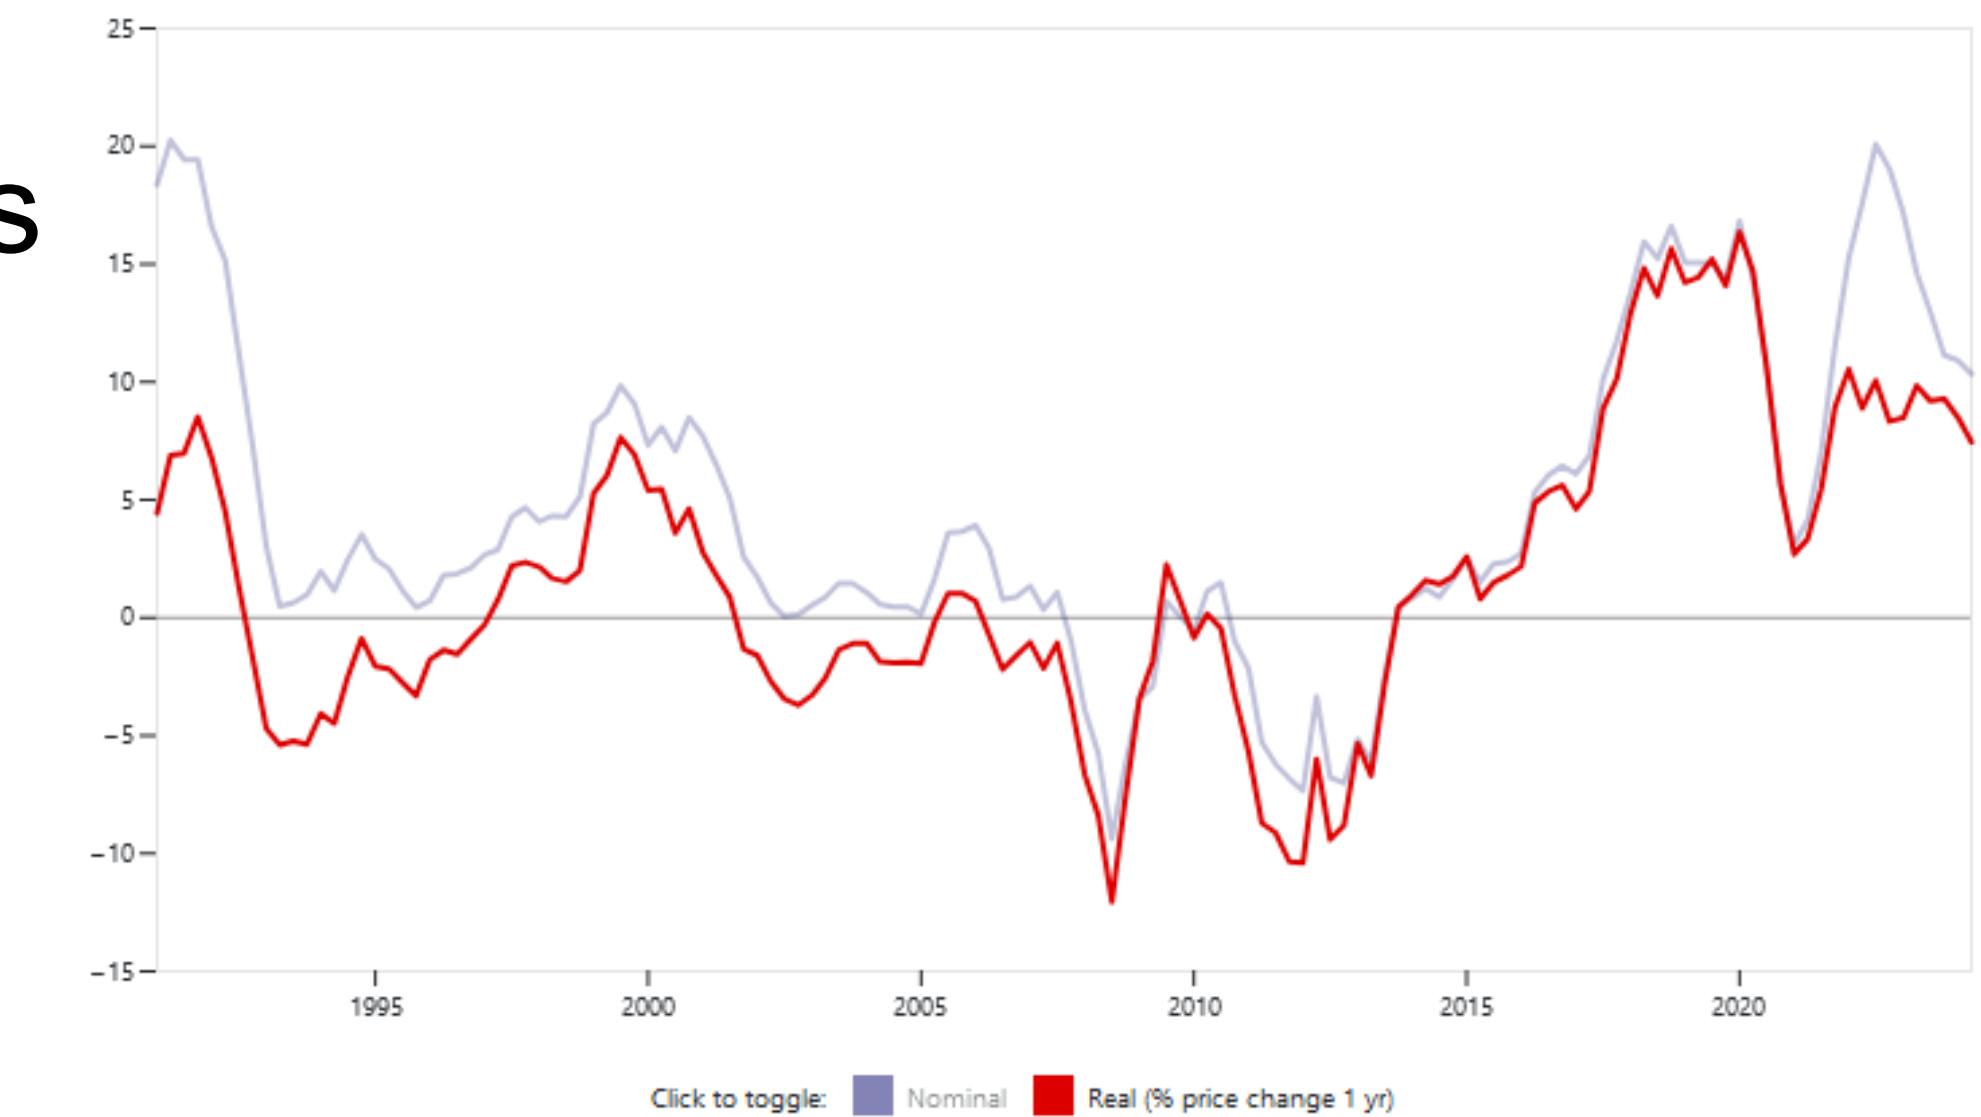

# Why is this Economics?

- Guessing game (Nagel, 1995) → *k-level reasoning*
- Used to explain financial markets → bubbles and crashes
- *Idea*: higher profit from investing in stocks others will buy, than fundamentally most valuable stocks
- Problem → right timing: *leave before it crashes*

Portugal's house price annual change

# Who am I?

- **Assistant professor, Economics Department**
  - since September 2024
- **M.Sc. in Economics Engineering**
  - Karlsruhe Institute of Technology (KIT)
  - University of Washington
  - Philips Group Negotiation (Amsterdam)
- **PhD in Economics (joint doctorate)**
  - University of Amsterdam
  - Ca' Foscari University of Venice
- **Post-Doc**
  - Bocconi University (Milan)

# Who am I?

- **Courses**
  - Experimental Economics (Bachelor & Master/PhD)
  - Game Theory (Master)
  - Industrial Organization (Bachelor)
- **Research interests**
  - Behavioral & Experimental Economics
  - Decision-making & Consumer behavior
    - financial investments
    - subscription/insurance decisions
    - health decisions: vaccinations
- **For more details:** <https://frieder-neunhoeffer.com>

# Who are you?

# Course goals

- Learn how individuals actually behave and make choices in economic situations using the methodology of experimental economics
- Compare observed behavior with the behavior assumed in standard economic theory
- Discuss how predictions of economic theory can be improved when experimental evidence is considered
- Learn how to design and conduct an experiment in economics
- Learn how to analyze experimental data

# Course outline and schedule

<b>Week 1</b>	<b>27-Jan</b>	<b>TUE</b>	Welcome + Syllabus: Overview, goals, program, grading,
	<b>29-Jan</b>	<b>THU</b>	Economics as an experimental discipline Experimental Economics vs Behavioral Economics Brief history of Experimental Economics
<b>Week 2</b>	<b>3-Feb</b>	<b>TUE</b>	The purpose and paradigms of Economic Experiments Fundamental design elements Measurement methods
	<b>5-Feb</b>	<b>THU</b>	LAB EXP #1 [This class meets in a computer room]

<b>Week 13</b>	<b>28-Apr</b>	<b>TUE</b>	Students presentations Groups

# Course requirements and policies

- **Lab reports**

- groups of 3-4 students
- due in print until Tue 12pm Lisbon time
- experimental data in excel format with

- **Group experiment**

- same group of 3-4 students
- design own experiment to test a specific hypothesis
- 20-minute presentation during last week

- **Class attendance and participation**

- be on time
- attendance sheets
- active participation is expected
- electronic devices (laptop) → no smartphone

### Abstract

The present study explores the impact of smartphone use on course comprehension and psychological well-being in the college classroom. One hundred and six students ( $N=106$ ) were assigned to either a control group or a quasi-experimental group. Participants in the quasi-experimental group were asked to leave their smartphones at the front desk upon entering the classroom. Participants in the control group were asked to leave their smartphones in their backpacks. Participants in both groups were asked to complete a survey at the end of the class. Results indicated that participants in the quasi-experimental group reported higher levels of course comprehension and psychological well-being than participants in the control group. These findings suggest that smartphone use negatively impacts course comprehension and psychological well-being in the college classroom.

On or off task: The negative influence of laptops on neighboring students' learning depends on how they are used

### ABSTRACT

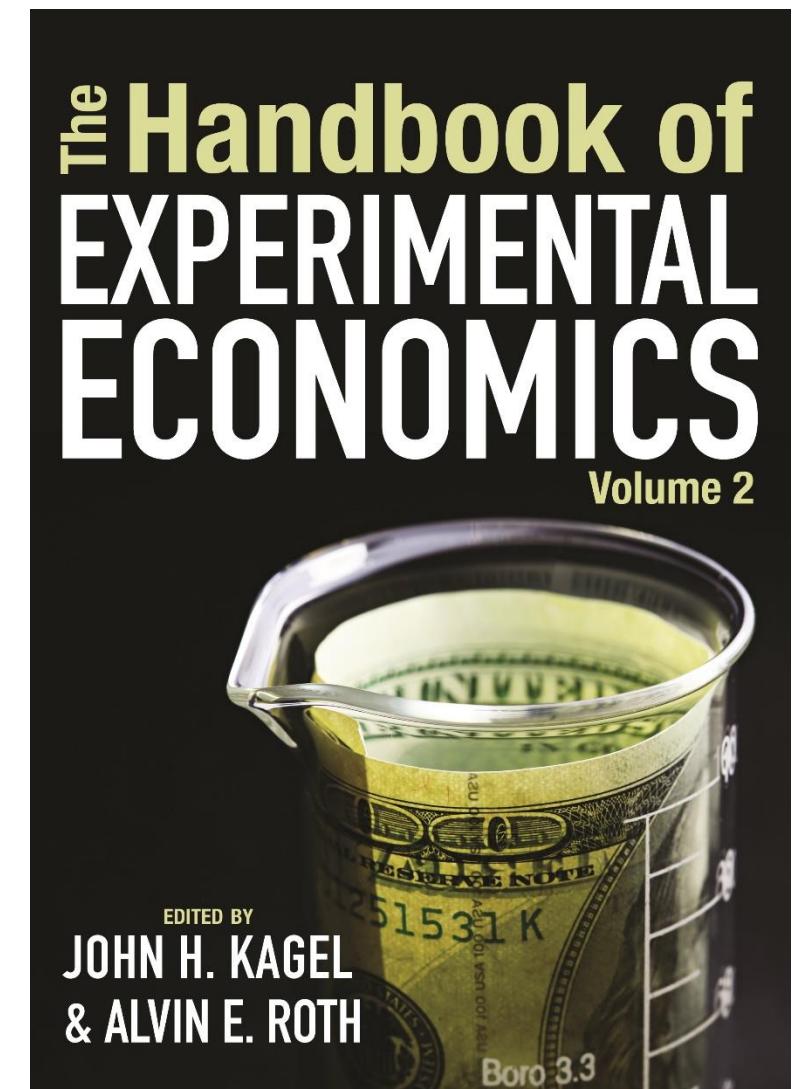

Previous research indicates that students' classroom laptop use distract their neighbors and negatively affects the learning of their neighbors. The purpose of this study was to examine whether the types of activities that laptop users undertake (i.e., on-task note-taking vs. off-task note-taking, and web browsing) differentially affect their neighbors' learning. Sixty-two participants (31 females and 31 males) participated in a classroom setting while seated either in front of, to the left of, to the right of, or behind their neighbors. Participants were assigned to one of four conditions based on their laptop use: (1) on-task note-taking, (2) off-task note-taking, (3) web browsing, and (4) no laptop use. Results indicated that participants in the on-task note-taking condition were more likely to be seated in front of their neighbors than participants in the off-task note-taking, web browsing, and no laptop use conditions. Participants in the on-task note-taking condition were also more likely to be seated to the left of their neighbors than participants in the off-task note-taking, web browsing, and no laptop use conditions. Participants in the off-task note-taking condition were more likely to be seated to the right of their neighbors than participants in the on-task note-taking, web browsing, and no laptop use conditions. Participants in the web browsing condition were more likely to be seated behind their neighbors than participants in the on-task note-taking, off-task note-taking, and no laptop use conditions. Participants in the no laptop use condition were more likely to be seated to the left of their neighbors than participants in the on-task note-taking, off-task note-taking, and web browsing conditions. These findings suggest that the types of activities that laptop users undertake (i.e., on-task note-taking vs. off-task note-taking, and web browsing) differentially affect their neighbors' learning.

# Grading policy

- Lab reports **35%**
- Group experiment **20%**
- Class attendance + participation + class experiments **10%**
- Final Project **35%**  
**100%**

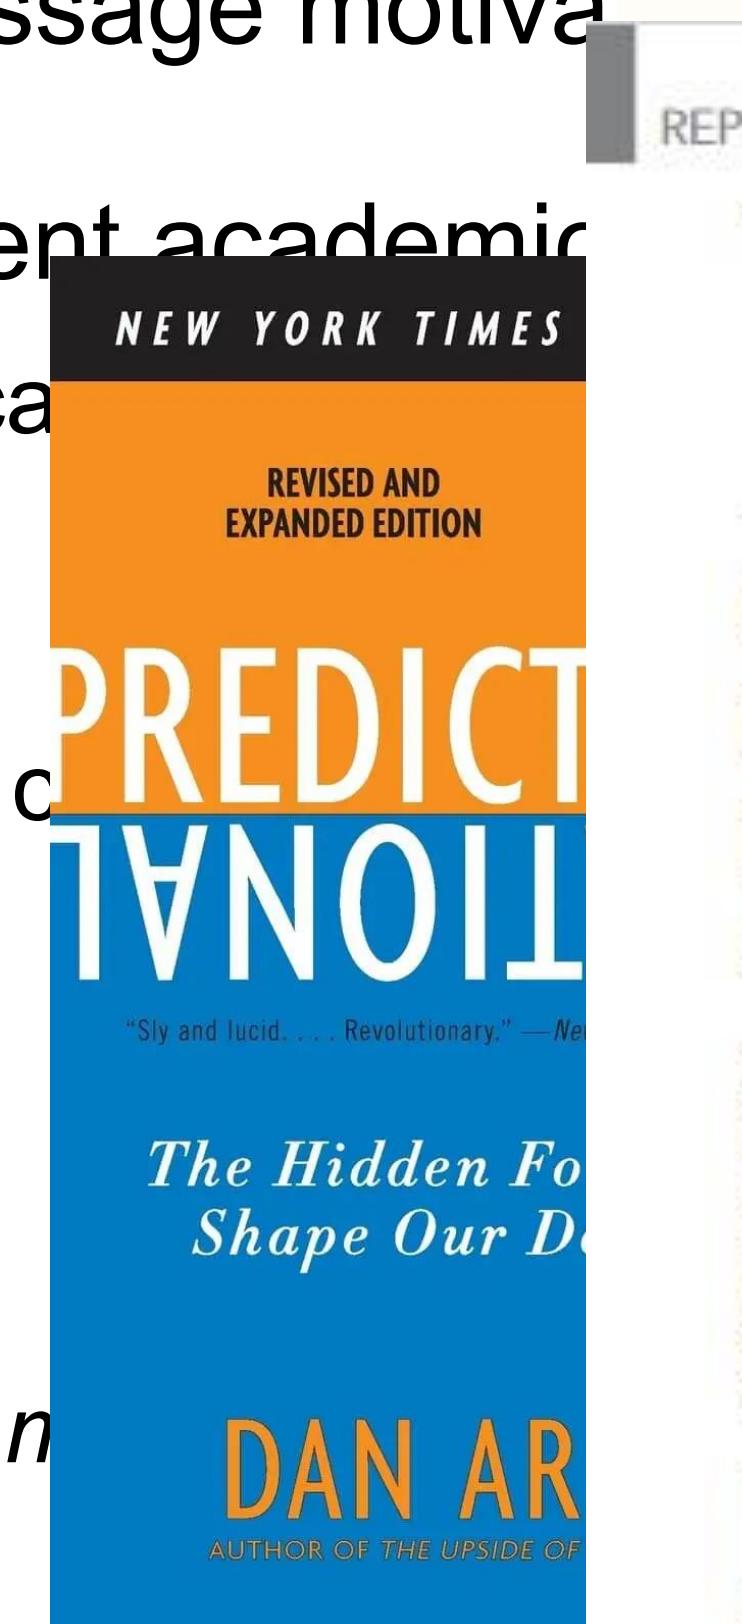

# Learning sources & how to prepare for class

- **FENIX**
  - Class announcements, lecture slides, and additional readings will be posted on FENIX prior to classes.
  - Make sure you check the course website regularly for updated information about the course.
- **Lecture material**
  - Lecture slides and readings constitute examinable material.
- **General text books (not compulsory)**
  - Kagel, J. and Roth, A. (2020). *The Handbook of Experimental Economics*. Princeton University Press.
  - Davis, D. and Holt, C. (2021). *Experimental Economics*, Princeton University Press.

# Course code of honor: an anecdote

- Experimental economics professor recommended: *Predictably Irrational* by Dan Ariely (2008)
- His fascinating experiments + personal message motivates me to do better in my academic career
- In 2023, one of the biggest scandals in recent academic history:
  - he and his co-authors were accused of fabricating data
- Uncovered by other academics
  - Dan Ariely is cancelled in academia and one of the most cited authors is removed from the list
- Course code of honor at ISEG
  - No cheating and plagiarism
  - GenAI (e.g., ChatbotGPT) – use responsibly
  - *google effect / digital amnesia* → *transactive memory*
- *Thinking, fast and slow* by Daniel Kahneman (2011)
  - Nobel prize winner in Economics in 2002

**REPORTS**

**Acknowledgments:** The present study was funded by NIH grants R01 MH086563 to W.A.S. and Y.N. and R01 MH058847 to W.A.S. We thank E. Wang, A. Shang, and N. Nystrom for expert animal care and E. Hargreaves, M. Yanike, and M. Shapiro for helpful comments. The authors declare no competing financial interests. Y.N. and W.A.S. designed the experiments and wrote the manuscript. Y.N. performed the experiment and analyzed the data.

**Google Effects on Memory: Cognitive Consequences of Having Information at Our Fingertips**

**Betsy Sparrow,<sup>1</sup>\* Jenny Liu,<sup>2</sup> Daniel M. Wegner<sup>3</sup>**

The advent of the Internet, with sophisticated algorithmic search engines, has made accessing information as easy as lifting a finger. No longer do we have to make costly efforts to find the things we want. We can "Google" the old classmate, find articles online, or look up the actor who was on the tip of our tongue. The results of four studies suggest that when faced with difficult questions, people are primed to think about computers and that when people expect to have future access to information, they have lower rates of recall of the information itself and enhanced recall instead for where to access it. The Internet has become a primary form of external or transactive memory, where information is stored collectively outside ourselves.

**In a development that would have seemed extraordinary just over a decade ago, many of us have constant access to information. If we need to find out the name of a person, we can just type it into a search engine and get an instant answer. This has changed the way we remember things. We no longer need to memorize facts and figures, as we can easily look them up online. This has led to what is known as "transactive memory".**
